- 4 Conclusions and further extensions.

We extend the Compound Poisson ruin model: The surplus process is $U(t) = u + ct - \sum_{i=1}^{N(t)} Y_i$ where

- \blacksquare *u* is the initial capital
- ct stands for the premiums assumed to arrive continuously over time
- $S(t) = \sum_{j=1}^{N(t)} Y_j$ is the aggregate-claims process, which is a compound Poisson process with rate $\beta > 0$ and i.i.d. claim amounts $\{Y_1, Y_2, ...\}$ with c.d.f. F(y) and p.d.f. f(y), y > 0
- A positive relative security loading θ is charged

We extend the Compound Poisson ruin model:

The surplus process is $U(t) = \mathbf{u} + ct - \sum_{j=1}^{N(t)} Y_j$ where

u is the initial capital

- ct stands for the premiums assumed to arrive continuously over time
- $S(t) = \sum_{j=1}^{N(t)} Y_j$ is the aggregate-claims process, which is a compound Poisson process with rate $\beta > 0$ and i.i.d. claim amounts $\{Y_1, Y_2, ...\}$ with c.d.f. F(y) and p.d.f. f(y), y > 0
- A positive relative security loading θ is charged

We extend the Compound Poisson ruin model:

The surplus process is $U(t) = u + ct - \sum_{j=1}^{N(t)} \overline{Y_j}$ where

- u is the initial capital
- ct stands for the premiums assumed to arrive continuously over time
- $S(t) = \sum_{j=1}^{N(t)} Y_j$ is the aggregate-claims process, which is a compound Poisson process with rate $\beta > 0$ and i.i.d. claim amounts $\{Y_1, Y_2, ...\}$ with c.d.f. F(y) and p.d.f. f(y), y > 0

A positive relative security loading θ is charged

└─ Single threshold models

Multiple threshold models

Changing premium rates or earning dividends:

The insurer's surplus at time *t* satisfies

$$dU(t) = \begin{cases} c_1 dt - dS(t), & b_0 \le U(t) < b_1 \\ \vdots \\ c_n dt - dS(t), & b_{n-1} \le U(t) < b_n \\ c_{n+1} dt - dS(t), & b_n \le U(t) \end{cases}$$

□ > < @ > < \(\exp\) > \(\exp\) \(\exp\) = \$\frac{2}{5/32}\$

-Multi-threshold Compound Poisson Surplus Process with Interest

Multi-threshold Compound Poisson Surplus Process with Interest

The insurer's surplus at time *t* satisfies

$$dU(t) = \begin{cases} c_0 dt + r_0 U(t) dt - dS(t), & b_{-1} = -c_0/r_0 < U(t) < b_0 \\ c_1 dt + r_1 U(t) dt - dS(t), & b_0 \le U(t) < b_1 \\ \vdots \\ c_n dt + r_n U(t) dt - dS(t), & b_{n-1} \le U(t) < b_n \\ c_{n+1} dt + r_{n+1} U(t) dt - dS(t), & b_n \le U(t) \end{cases}$$

Motivation and problem description

- Ruin models incorporating multiple thresholds allow the insurer to change the premium rate charged depending on the current surplus level.
- In addition, interest might be earned on the liquid reserves. Conversely, if the surplus drops below zero, the amount of the deficit might be borrowed under a known in advance interest rate.
- It seem to be realistic to consider models which allow more flexibility upon claims, beyond the Poisson case. We consider a Markovian Arrival Process (MAP) with an underlying continuous time Markov chain with m states (later restricted to a renewal process).

Erlang interclaims with ME claims

$$\mathbf{D_0} = \begin{bmatrix} -\lambda_1 & \lambda_1 & 0 & \dots & 0\\ 0 & -\lambda_2 & \lambda_2 & \dots & 0\\ \dots & \dots & \dots & \dots & \dots\\ 0 & 0 & 0 & \dots & -\lambda_n \end{bmatrix},\\ \mathbf{D_1} = \begin{bmatrix} 0 & 0 & 0 & \dots & 0\\ 0 & 0 & 0 & \dots & 0\\ \dots & \dots & \dots & \dots\\ \lambda_n & 0 & 0 & \dots & 0 \end{bmatrix}$$

Assume also that claim sizes are ME distributed: $\tilde{b}_{ij}(s) = \tilde{b}(s) = \frac{p_1 s^{m-1} + p_2 s^{m-2} + \cdots + p_m}{q_0 s^m + q_1 s^{m-1} \cdots + q_m}, \quad q_0 = 1. \quad (4)$

Generalized Erlang interclaim times with Matrix Exponential claims

Consequently,

$$b^{(m)}(\cdot) + q_1 b^{(m-1)}(\cdot) + \cdots + q_m b(\cdot) = 0,$$
 (5)

and

$$\begin{cases} (c+ru)\Phi_{1}'(u) = (\delta + \lambda_{1})\Phi_{1}(u) - \lambda_{1}\Phi_{2}(u), \\ (c+ru)\Phi_{2}'(u) = (\delta + \lambda_{2})\Phi_{2}(u) - \lambda_{2}\Phi_{3}(u), \\ \vdots \\ (c+ru)\Phi_{n}'(u) = (\delta + \lambda_{n})\Phi_{n}(u) - \lambda_{n}[N_{\Phi_{1}}(u) - A(u)]. \end{cases}$$
(6)

■ If claim sizes satisfy (5) then,

$$\sum_{j=0}^{m} q_j N_{\Phi_1}^{(m-j)}(u) = \sum_{j=0}^{m-1} \xi_j \Phi_1^{(m-1-j)}(u),$$
(7)
where $\xi_j = \sum_{k=0}^{j} q_{j-k} f^{(k)}(0).$

■ For penalty functions that depend only on the deficit, i.e., w(x, y) = w(y), we arrive at

$$\prod_{i=1}^{n} \frac{\delta + \lambda_i}{\lambda_i} \left(\sum_{j=0}^{m} q_{m-j} \mathcal{D}_u^{(j)} \right) \left(\prod_{i=1}^{n} \left(1 - \frac{c + ru}{\delta + \lambda_i} \mathcal{D}_u \right) \right) \Phi_1(u)$$
$$= \left(\sum_{j=0}^{m-1} \xi_{m-1-j} \mathcal{D}_u^{(j)} \right) \Phi_1(u), \quad \text{where } \mathcal{D}_u^{(0)} = 1.$$
(8)

• Let x = c + ru and $\Phi_1(u) = z(x)$.

We seek the solutions of the form

$$z(x) = z(x, \alpha) = \sum_{k=0}^{\infty} a_k x^{k+\alpha},$$

with $a_k = a_k(\alpha)$ and $a_0 = 1$.

□ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶

Finally, we obtain

$$\sum_{l=0}^{m-1} \left\{ \sum_{j=m-l}^{m} r^{j} \left[Kq_{m-j} \gamma_{j-(m-l)}(\alpha) -\xi_{m-j-1} \right] a_{j-(m-l)} \left[\alpha + j - (m-l) \right]_{(j)} \right\} x^{\alpha - (m-l)} + \sum_{k=0}^{\infty} \left\{ \sum_{j=0}^{m} r^{j} \left[Kq_{m-j} \gamma_{j+k}(\alpha) - \xi_{m-j-1} \right] a_{j+k} \left[\alpha + j + k \right]_{(j)} \right\} x^{\alpha + k} = 0.$$

Since $a_0 = 1$ and $r \neq 0$, coefficient of $x^{-m+\alpha}$ is zero if and only if $K\gamma_0(\alpha) \ (\alpha)_{(m)} = 0$, which yields

$$\left(\prod_{i=1}^n \left(1 - \frac{r\alpha}{\delta + \lambda_i}\right)\right) \ \alpha \ (\alpha - 1) \dots (\alpha - m + 1) = 0.$$

Generalized Erlang interclaim times with Matrix Exponential claims

Probability of ruin for Generalized Erlang(2) arrivals with exponential claim amounts

$$M(a,b;x) = 1 + \sum_{n=1}^{\infty} \left[\frac{[a]^{(n)}}{n![b]^{(n)}} \right] x^n,$$
$$[a]^{(n)} = a(a+1)\dots(a+n-1),$$
$$U(a,b;x) = \frac{\pi}{\sin\pi b} \left\{ \frac{M(a,b;x)}{\Gamma(1+a-b)\Gamma(b)} - x^{1-b} \frac{M(1+a-b,2-b;x)}{\Gamma(a)\Gamma(2-b)} \right\},$$

for *b* non-integer.

Generalized Erlang interclaim times with Matrix Exponential claims

Probability of ruin for Generalized Erlang(2) arrivals with exponential claim amounts

For b integer,

$$\begin{split} U(a,n+1;x) &= \frac{(-1)^{n+1}}{n!\Gamma(a-n)} \left\{ M(a,n+1;x)\ln(x) \right. \\ &+ \sum_{l=0}^{\infty} \frac{[a]^{(l)}}{[n+1]^{(l)}} \left[\varsigma(a+l) - \varsigma(1+l) - \varsigma(1+n+l) \right] \frac{x^l}{l!} \right\} \\ &+ \frac{(n-1)!}{\Gamma(a)} x^{-n} M(a-n,1-n,x)_n, \end{split}$$

for n = 0, 1, 2, ..., where the subscript *n* on the last $M(\cdot)$ function denotes the partial sum of the first *n* terms. This term is to be interpreted as zero when n = 0 and $\varsigma(a) = \frac{\Gamma'(a)}{\Gamma(a)}$. Also,

$$\varsigma(1) = -\gamma, \quad \varsigma(n) = -\gamma + \sum_{k=1}^{n-1} k^{-1},$$

and $\gamma = 0.5772...$ is the Euler constant.

Generalized Erlang interclaim times with Matrix Exponential claims

Probability of ruin for Generalized Erlang(2) arrivals with exponential claim amounts

When *x* approaches infinity (Abramowitz and Stegun)

$$x^{\lambda_{1r}-1}M(1+\lambda_{1r},1+\lambda_{1r}-\lambda_{2r};\beta_r x)=\infty,$$

$$x^{\lambda_{1r}-1}e^{-\beta_r x}U(1+\lambda_{1r},1+\lambda_{1r}-\lambda_{2r},+\beta_r x)=0.$$

Generalized Erlang interclaim times with Matrix Exponential claims

Probability of ruin for Generalized Erlang(2) arrivals with exponential claim amounts

$$\lim_{x\to\infty} y(x) = \lim_{u\to\infty} \psi'_1(u) = 0, \text{ so } \kappa_1 = 0.$$

Therefore, $y(x) = \kappa_2 x^{\lambda_{1r}-1} e^{-\beta_r x} U(1 + \lambda_{1r}, 1 + \lambda_{1r} - \lambda_{2r}; +\beta_r x),$ which yields

$$\zeta(x) = 1 + \kappa_2 \int_0^x v^{\lambda_{1r}-1} e^{-\beta_r v} U(1+\lambda_{1r}, 1+\lambda_{1r}-\lambda_{2r}; \beta_r v) dv.$$

Recall that $\lim_{u\to\infty} \psi_1(u) = 0$.

Generalized Erlang interclaim times with Matrix Exponential claims

Probability of ruin for Generalized Erlang(2) arrivals with exponential claim amounts

Immu lim
$$_{x \to \infty} y(x) = \lim_{u \to \infty} \psi'_1(u) = 0$$
, so $\kappa_1 = 0$.
Therefore,
 $y(x) = \kappa_2 x^{\lambda_{1r}-1} e^{-\beta_r x} U(1 + \lambda_{1r}, 1 + \lambda_{1r} - \lambda_{2r}; +\beta_r x)$, which yields

$$\zeta(x) = 1 + \kappa_2 \int_0^x v^{\lambda_{1r} - 1} e^{-\beta_r v} U(1 + \lambda_{1r}, 1 + \lambda_{1r} - \lambda_{2r}; \beta_r v) dv.$$

Recall that $\lim_{u\to\infty} \psi_1(u) = 0$.

Generalized Erlang interclaim times with Matrix Exponential claims

Probability of ruin for Generalized Erlang(2) arrivals with exponential claim amounts

Finally,

$$\kappa_2 = \frac{1}{\int\limits_0^\infty v^{\lambda_{1r}-1} e^{-\beta_r v} U(1+\lambda_{1r}, 1+\lambda_{1r}-\lambda_{2r}; \beta_r v) dv}$$

and

$$\psi_{1}(u) = 1 - \frac{\int_{0}^{ru+c} v^{\lambda_{1r}-1} e^{-\beta_{rv}} U(1+\lambda_{1r}, 1+\lambda_{1r}-\lambda_{2r}; \beta_{rv}) dv}{\int_{0}^{\infty} v^{\lambda_{1r}-1} e^{-\beta_{rv}} U(1+\lambda_{1r}, 1+\lambda_{1r}-\lambda_{2r}; \beta_{rv}) dv}.$$

Examples. Numerical results

- We consider Example 6.1. from Gerber and Yang (2007) (Exp interclaims) versus our results for (Gen)Erlang(2) interclaims.
- We assume the interclaims are gen-Erlang (2), with param. λ₁ and λ₂ under three different scenarios, summarized in the following table.
- The claim size is exponential $\beta = 0.5$ and the premium rate c = 2.

• We assume that the interest rate is constant at r = 0.1.

Generalized Erlang interclaim times with Matrix Exponential claims

Probability of ruin for Generalized Erlang(2) arrivals with exponential claim amounts

Generalized Erlang interclaim times with Matrix Exponential claims

Probability of ruin for Generalized Erlang(2) arrivals with exponential claim amounts

- In all scenarios, as the initial surplus decreases the absolute ruin probability increases.
- Comparing the first three columns, it is clear that the most risky case is the third one, where the process waits less in average for a claim to appear.
- Comparing the last two columns, the latter Erlang(2) and the exponential case are different, although they have the same mean 1.
 - For positive values of the initial surplus, the Erlang case is less likely to lead to ruin than the exponential. However, for sufficient negative values of the surplus, the reverse situation happens.
 - Credible explanation...

Conclusions and possible extensions

- We presented a unifying approach for the determination of the G-S function related to absolute ruin in a single layer Sparre Andersen risk model in the presence of a constant interest rate.
 - These results can be easily extended to the multi-layer case, since the equations are structurally the same.
 - It seems that one can use the same methodology by replacing the Generalized Erlang(n) interclams by a Triangular Phase-type distribution as considered in O'Cinneide (1993).
- We remark that it is very challenging to obtain closed-form solutions for the absolute ruin probability if we move away from the exponential assumption for claim sizes, or if we assume a higher order generalized Erlang interclaim time distributioin. However, one can use out methodology to obtain numerical results for any ME claim sizes.
