**I. MORTALITY UNDER STANDARD ORDINARY
INSURANCE ISSUES BETWEEN 1975
AND 1976 ANNIVERSARIES**

ABSTRACT

This is the latest in a series of annual reports on intercompany mortality experience under Standard Ordinary life insurance policies. Each of the tables included in this report (with some minor exceptions) shows amount exposed to risk, actual amounts of death claims, expected amounts of death claims, and mortality ratios of actual to expected death claims. The expected death claims are based on the 1965-70 Basic Tables. All of the experience is derived from the contributions of twenty large life insurance companies. However, not all of the companies contributed to all aspects of the study. The tables each are based on either select (first fifteen policy years) or ultimate (policy years sixteen and subsequent) experience.

The following results, which exclude the effect of war deaths, summarize the important conclusions reached in this study.

General Mortality between 1975 and 1976 Anniversaries

The overall medical mortality ratio in the select period declined by 4.2 percentage points from last year's study.

The overall nonmedical mortality ratio in the select period declined by 6.4 percentage points from last year's study.

On the basis of limited data in the select period, the overall paramedical mortality ratio declined by 4.1 percentage points from last year's study.

The overall mortality ratio in the ultimate period declined by 2.1 percentage points from last year's study.

Medical versus Nonmedical Mortality between 1971 and 1976 Anniversaries

In the select period, for all policy years combined, nonmedical mortality continued to be higher than medical mortality at issue ages 20-24 and 30-49, but was lower than medical mortality at issue ages 0-19, 25-29, and 50 and over (Table 5).

In the ultimate period, nonmedical mortality exceeded medical mortality except at attained ages 15–19 (Table 7).

For males in the select period for all policy years combined, nonmedical mortality exceeded medical mortality at issue ages 20 and over (Table 11).

For females in the select period for all policy years combined, nonmedical mortality exceeded medical mortality at issue ages 1–9 and 40 and over (Table 11).

Premium-paying versus Fully Paid-up Mortality in the Ultimate Period, between 1971 and 1976 Anniversaries

Overall, mortality on premium-paying insurance exceeded that on fully paid-up insurance by 2.7 percentage points. However, for attained ages 15–19 and 30–59, the mortality ratios were higher for paid-up insurance (Table 8).

Male versus Female Mortality between 1971 and 1976 Anniversaries

There was little change from last year's report, with female mortality averaging about 60 percent of male mortality (Tables 9, 10, and 12).

INDEX OF TABLES

INTRODUCTION

THIS report covers the intercompany mortality experience under Standard Ordinary insurance issues between 1975 and 1976 policy anniversaries, and also for the period between 1971 and 1976 policy anniversaries where one year's exposure generally provided an insufficient volume of data. It reviews the mortality experience under the following:

1. Standard Ordinary insurance issued subject to a medical examination, observed during each of the first fifteen policy years;
2. Standard Ordinary insurance issued without a medical examination, observed during each of the first fifteen policy years; and
3. Standard Ordinary insurance observed during the sixteenth and subsequent policy years. As in previous reports, this ultimate experience is shown for medical and nonmedical issues combined, with a portion of it also shown for medical and nonmedical issues separately. A table comparing the ultimate experience under premium-paying and fully paid-up (excluding reduced paid-up) policies also has been included.

A summary of aggregate mortality ratios, excluding war deaths, based on the 1965-70 Basic Tables for each major category of experience is as follows:

EXPERIENCE BETWEEN POLICY ANNIVERSARIES

	1974-75	1975-76
Medical select.....	85.1%	80.9%
Paramedical select*.....	85.5	81.4
Nonmedical select.....	94.9	88.5
Ultimate.....	87.1	85.0

* Note that the paramedical experience is concentrated in the early policy years.

The tabulation on page 4 shows war deaths (see definition in Appendix II) by amount and the ratio of war deaths to total deaths experienced between 1971 and 1976 policy anniversaries.

Because of the declining proportion of total deaths represented by war deaths and their minor effect on the mortality ratios, it is felt that the impact of war deaths can be ignored for all practical purposes. For consistency with prior studies, all tables (except the detailed tables in Appendix I) exclude the effect of war deaths.

The names of the twenty companies that contributed their experience between 1975 and 1976 policy anniversaries, and their proportionate

contributions to the 1975-76 exposure, are given in Table A of Appendix I. One of those twenty companies had not been a contributor prior to the contribution of its experience between 1975 and 1976 anniversaries.

**EXPERIENCE UNDER STANDARD ISSUES DURING THE
FIRST FIFTEEN YEARS OF INSURANCE**

Medically Examined Issues

The current experience during the first fifteen policy years is based on an exposure of \$150 billion and actual deaths of \$431 million. This represents an increase in the exposure from the preceding year of about 4.4 percent. Slightly more than half of that increase is due to the addition of a new contributing company this year.

The 1965-70 Male and the 1965-70 Female Select Basic Tables (*TSA, 1973 Reports*, p. 199, and *TSA, 1974 Reports*, p. 57) were used to calculate expected deaths separately for the male experience and the female experience. The expected deaths for these two classes of experience were combined in some of the tables, and the mortality ratios were calculated excluding war deaths.

The experience by age group at issue is shown in Table 1 for the first fifteen policy years combined. The experience by year of issue is presented in Table 2. The detailed experience by age group at issue for each year of issue is set forth in Table B of Appendix I.

All years of issue.....		\$149,547,734	\$431,479	\$533,205	80.9%

* Excluding war deaths.

The aggregate medical mortality ratio, excluding war deaths, for the period from 1975 to 1976 anniversaries was 80.9 percent. The following tabulation compares this result with the results of previous studies based on the 1965–70 Basic Tables.

Exposure Year	Aggregate Mortality Ratio
1972–73.....	92.8%
1973–74.....	87.9
1974–75.....	85.1
1975–76.....	80.9

As seen in Table 1, there were three issue-age groups that showed medical mortality ratios greater than 100.0 percent for the 1975–76 exposure period: issue ages 5–9, 10–14, and 15–19.

As seen in Table 2, medical mortality ratios by year of issue ranged from 74.5 percent for 1965 (policy year 11) to 92.6 percent for 1975 (policy year 1).

The following tabulation indicates the variation in the aggregate medical mortality ratios for the contributing companies from the all-company average of 80.9 percent.

	Number of Companies	Proportion of Actual Deaths
Percentage points below average:		
More than 20.....	3	11.2%
10–20.....	4	12.4
5–10.....	3	6.3
0–5.....	1	3.5
Percentage points above average:		
0–5.....	1	10.0
5–10.....	6	49.5
10–20.....	0	0.0
More than 20.....	2	7.1

Nonmedical Issues

The current experience during the first fifteen policy years is based on an exposure of \$120 billion and actual deaths of \$108 million. This represents an increase in the exposure from the preceding year of about 5.4 percent. Somewhat less than one-fifth of that increase is attributable to a new contributing company this year.

Expected deaths were calculated on the 1965–70 Select Basic Tables in the same manner as for medically examined issues. Those basic tables were based on experience under medical issues.

For all age groups combined, nonmedical business now comprises 41.4 percent of the total experience on recent Ordinary issues, measured by

the exposures during the first fifteen policy years, as compared with 42.3 percent last year. For all age groups combined, the proportion of nonmedical issues in the first policy year for 1975-76 was 40.0 percent, compared with 42.4 percent in last year's report. The following tabulation shows nonmedical exposures as a percentage of total medical, non-medical, and paramedical exposures, by age group at issue, for experience between 1975 and 1976 anniversaries.

**NONMEDICAL EXPOSURES AS PERCENTAGE
OF TOTAL EXPOSURES**

Ages at Issue	Policy Year 1	Policy Years 1-15
0-9.....	92.7%	89.6%
10-19.....	90.3	88.5
20-29.....	64.0	66.3
30-39.....	20.5	22.2
40-49.....	3.8	3.5
50 and over.....	.8	.4
All ages.....	40.0%	41.4%

The mortality ratios for nonmedical issues are presented in Table 3 by age group at issue for the first fifteen policy years combined. The aggregate mortality ratio, excluding war deaths, for the period from 1975 to 1976 anniversaries was 88.5 percent. The following tabulation shows how this result compares with the results of the previous studies based on the 1965-70 Basic Tables.

Exposure Year	Aggregate Mortality Ratio
1972-73.....	102.2%
1973-74.....	99.1
1974-75.....	94.9
1975-76.....	88.5

The mortality ratios in Table 3 (and in Table 4) generally underestimate somewhat the death rates for nonmedical business because, in calculating the expected deaths, no adjustment was made for the fact that the average ages of the exposures under nonmedical issues for each of the issue-age groups 35-39, 40-44, 45-49, and 50 and over are lower than the average ages of the exposures for each of those age groups in the medical experience entering into the 1965-70 Basic Tables. This situation arises because the maximum age at which nonmedical business is issued by the various contributing companies is generally 35, 40, 45, or 50. Thus the nonmedical exposures beyond each of those issue ages tend to

† Exposures not adjusted for distribution by age within each five-year age group at issue.

fall off sharply. It is likely that a further understatement of expected deaths arises from the general practice of reducing nonmedical amount limits in steps of \$5,000 or \$10,000 beyond issue ages such as 35 and 40.

An indication of the extent to which Table 3 understates the true mortality on nonmedical business is given in the tabulation at the top of page 9, which shows mortality ratios adjusted for the distribution of exposures by age within each five-year age group at issue. Only the nonmedical age limits of the contributing companies were considered in making this adjustment; the reductions in amount limits mentioned previously were not considered.

The unadjusted mortality ratios understate the true mortality experience on nonmedical business to a significant degree at issue ages 40-44 and 45-49. Nonmedical issues at ages 45-49 and especially at ages 50 and over arise largely from business issued under special circumstances (such as pension trust and salary allotment plans) and do not affect appreciably the distribution of exposures by age within each five-year age group at issue. So-called policyholder's nonmedical, issued on the basis of a previous medical examination within six or twelve months, is also included for some companies; others include it in their medical issues.

† Exposures not adjusted for distribution by age within each five-year age group at issue.

The nonmedical mortality ratios by calendar year of issue for all ages at issue combined during the period from 1975 to 1976 anniversaries are presented in Table 4 on an unadjusted basis. The mortality ratios ranged from 73.9 percent for issue year 1975 (policy year 1) to 98.5 percent for issue year 1973 (policy year 3).

The details of the unadjusted experience by age groups at issue for each year of issue are set forth in Table C of Appendix I.

Comparison of Medical and Nonmedical Experience

It would be desirable to compare the nonmedical experience with the experience on strictly comparable policies issued with a medical examination, but data for such a comparison are not available.¹ Table 5 presents side by side the experience on medical and nonmedical issues as reported to the Committee for the five-year period from 1971 to 1976 anniversaries. The 1965-70 Male, Female, and Male and Female Combined Select Basic Tables, respectively, were used to calculate expected deaths for the male experience, female experience, and experience reported without subdivision by sex.

The nonmedical mortality ratios shown in Table 5 have been adjusted

¹ Five factors, among others, that should be considered in the comparisons presented in this study are the following: (a) the relative proportions of medical and nonmedical business differ among companies (see Appendix I, Table A); (b) the underwriting standards of the contributing companies differ; (c) the age distributions of the various types of business differ; (d) the proportions of business applied for nonmedically but issued subject to medical examination and then classified as medical business differ among companies; and (e) medical business generally is for larger amounts and is sold at a higher average socioeconomic level.

to reflect the approximate distribution of nonmedical exposures by age for issue-age groups 35-39 and higher. The lower half of Table 5 shows that, for policy years 1-15 combined, nonmedical mortality exceeds medical mortality appreciably at issue ages 20-24 and 30-49; the excess ranges from about 4 percent at issue ages 45-49 to about 37 percent at issue ages 40-44.

† Exposures adjusted for distribution by age within each five-year age group at issue.

Paramedically Examined Issues

Companies were asked to submit their data on paramedically examined business separately. Eighteen companies were able to comply. Of the approximately \$21 billion of paramedical exposure submitted for 1975-76, about 93 percent is concentrated in the first three policy years and almost all is concentrated in the first six policy years. The approximately \$10 billion of paramedical exposure in the first policy year (year of issue 1975) is about 53 percent of the medically examined exposure in the first policy year and about 52 percent of the nonmedical exposure in the first policy year. The 1975-76 paramedical data for each year of issue since 1970, along with the corresponding mortality ratios for medical and non-medical business, are as follows for males and females combined, excluding war deaths:

Year of Issue	Policy Year	Paramedical Exposed to Risk in \$1,000's	Actual Paramedi- cal Deaths in \$1,000's	Para medical Mortality Ratio	Medical Mortality Ratio	Nonmedical Mortality Ratio
1970.....	6	\$ 57,652	\$.30	26.1%	86.6%	95.8%
1971.....	5	326,278	602	88.5	78.8	94.0
1972.....	4	1,068,950	1,762	86.3	83.8	93.8
1973.....	3	2,916,162	4,078	84.0	77.2	98.5
1974.....	2	5,973,625	5,719	75.2	85.2	78.6
1975.....	1	10,248,572	8,570	83.9	92.6	73.9
Total.....		\$20,591,239	\$20,761	81.4%*	83.6%*	87.1%*

* This figure is for policy years 1-6 only. Note that the distribution of exposures by policy year for the medical and nonmedical data (Tables 2 and 4) is quite different from the distribution shown in the above table for the paramedical data.

**EXPERIENCE UNDER STANDARD ISSUES DURING THE
SIXTEENTH AND SUBSEQUENT POLICY YEARS**

The current experience during the sixteenth and subsequent policy years is based on an exposure of \$80 billion and actual deaths of \$1,088 million excluding war deaths. This represents an increase in the exposures from the preceding year of about 5.1 percent. About one-fourth of that increase is attributable to a new contributing company this year, but the effect of the new company is approximately offset by the fact that one company that contributed its ultimate experience last year could not do so this year.

Mortality ratios are presented in Table 6 by attained-age groups based on (1) the 1965-70 Ultimate Basic Tables (Male, Female, and Male and Female Combined, respectively, for the male experience, the female experience, and the experience reported without subdivision by sex);

† Excluding war deaths.

(2) the Commissioners 1941 Standard Ordinary Mortality Table; and
 (3) the Commissioners 1958 Standard Ordinary Mortality Table. The aggregate mortality ratio, excluding war deaths, on the 1965-70 Ultimate Basic Tables for the period from 1975 to 1976 anniversaries was 85.0 percent.

The following tabulation shows how this result compares with the previous studies based on the 1965-70 Basic Tables.

Exposure Year	Aggregate Mortality Ratio
1972-73.....	93.8%
1973-74.....	93.4
1974-75.....	87.1
1975-76.....	85.0

The tabulation that follows indicates the variation in the aggregate mortality ratios of the contributing companies from the 1975-76 all-company average of 85.0 percent.

	Number of Companies	Proportion of Actual Deaths
Percentage points below average:		
10-20.....	1	4.2%
5-10.....	5	14.1
0-5.....	5	27.0
Percentage points above average:		
0-5.....	5	16.1
5-10.....	3	38.6

Comparison of Medical and Nonmedical Experience

Companies were asked to subdivide their ultimate data into medical and nonmedical if they could do so conveniently. Twelve companies were able to subdivide their data in this manner. The results of this experience between 1971 and 1976 anniversaries are shown in Table 7. These data involve exposures that comprise 47.7 percent of the entire ultimate experience reported for the period as compared with 46.6 percent for the previous study.

For all attained-age groups except 15-19, the nonmedical mortality is higher than the medical mortality.

Comparison of Premium-paying and Fully Paid-up Experience

A comparison of the mortality on premium-paying and fully paid-up (excluding reduced paid-up) policies for the period from 1971 to 1976 anniversaries is shown in Table 8 for standard medical and nonmedical issues combined. Fifteen companies submitted their experience separately on premium-paying policies, and thirteen companies did so on fully paid-up policies. On the basis of the experience between 1971 and 1976 anniversaries, data identified as premium-paying constituted 78.8 percent and data identified as fully paid-up constituted 14.0 percent of the total ultimate experience of all companies.

At the higher attained ages, mortality ratios are consistently higher on premium-paying than on fully paid-up policies. For all attained ages combined, the mortality ratio on premium-paying policies exceeds the mortality ratio on fully paid-up policies by 2.7 percentage points.

EXPERIENCE BY SEX

For the select period, each of the twenty contributing companies submitted all of its medical and all of its nonmedical data separately for males and females.

The detailed select experience by sex for the period from 1975 to 1976 policy anniversaries by age group at issue for each year of issue is presented in Table D of Appendix I for medical issues and in Table E of Appendix I for nonmedical issues. Expected deaths were calculated on the 1965-70 Male Select Basic Table for male lives and on the 1965-70 Female Select Basic Table for female lives.

Tables 9-11 examine the experience by sex between 1971 and 1976 policy anniversaries for the select data, and Table 12 does the same for the ultimate data.

The mortality ratios by age group at issue and sex for the first fifteen

* Based on data from twelve companies.

† Excludes war deaths.

policy years combined, covering the experience from 1971 to 1976 anniversaries, are presented in Table 9 for standard medically examined issues and in Table 10 for standard nonmedical issues. For the purpose of comparing male and female mortality, the right-hand column of each of these tables is based on mortality ratios for females with expected deaths calculated on the male table. The highest ratios of female to male mortality are found at issue ages 0, 1, 10–14, and 25–29 for medical issues and at issue ages 25–39 for nonmedical issues. For all issue ages combined, the ratio of female to male mortality is 64.2 percent for medical issues and 57.7 percent for nonmedical issues.

Table 11 presents side by side the experience for the five-year period from 1971 to 1976 anniversaries on medical and nonmedical issues, separately for each sex, for policy years 1–2, 3–5, 6–10, 11–15, and 1–15.

* Excludes war deaths.

† Nonmedical exposures adjusted for distribution by age within each five-year age group.

The nonmedical mortality ratios shown in Table 11 have been adjusted approximately to reflect the distribution of nonmedical exposures by age for issue-age groups 35-39 and over. For males, the ratios of the nonmedical to the medical mortality exceed 100 percent at issue ages 20 and over in policy years 1-15 combined. For females, the ratios exceed 100 percent for issue ages 1-9 and 40 and over in policy years 1-15 combined.

The mortality ratios by attained-age groups and sex for policy years sixteen and over combined, covering the experience from 1971 to 1976 anniversaries, are presented in Table 12 for standard medical and standard nonmedical issues combined. Again, for the purpose of comparing male and female mortality, the right-hand column of this table is based on mortality ratios for females with expected deaths calculated on the male table. Fifteen of the contributing companies submitted data separately for males and females for policy years 16 and over. The highest ratios of female to male mortality are found at attained ages 40-49 and 85-95.

Note.—A Comparative Mortality Study of the select experience between 1971 and 1976 anniversaries for the above companies is available upon request to the Office of the Society of Actuaries. The companies are not identified by name but are differentiated simply by a system of code letters. Experience is shown by issue-age groups and by issue year separately for medical and nonmedical business.

APPENDIX II

DEFINITION OF "WAR DEATHS"

War deaths are identified by the 1970 Committee Code 99. In coding for war deaths, some companies may refer to the Report of Casualty form furnished by the various armed forces. Item 2 of this form has two boxes to indicate whether death arose in "battle" or "non-battle." In addition to all "battle" deaths, it should be noted that many (but not all) "non-battle" deaths should be coded 99. For example, a death arising after battle but due to burns received in battle may be coded by the government as a "non-battle" death. In cases like this, a review of the comments given in item 2 is necessary to determine the full facts and whether death was due to the operations of war and hence should be coded 99.

Questions may arise with regard to the coding of military service deaths outside the combat area which may nevertheless be attributable to the Vietnam operation. For example, a plane on the way to Vietnam may crash far outside the Vietnam area, or a death in Japan may be the result of activity for the benefit of the Vietnam engagement. Such details should be treated as due to the operations of war and coded 99.

Military service deaths that cannot be tied in with the Vietnam engagement should not be treated as due to operations of war. For example, the Committee's code 89 would apply to a death resulting from a plane crash in Germany. Deaths occurring in the United States and Canada, not tied in with the Vietnam engagement, should also be assumed not due to war.

Due to the relatively low death rate from disease among troops in Vietnam, no deaths from disease should be considered war deaths.
