1979 REPORTS

IV. MORTALITY UNDER INDIVIDUAL IMMEDIATE ANNUITIES, LIFE INCOME SETTLEMENTS, AND MATURED DEFERRED ANNUITIES BETWEEN 1971 AND 1976 ANNIVERSARIES

ABSTRACT

This report presents the 1971-76 mortality experience of fifteen large life insurance companies under (1) individual immediate annuities; (2) life income settlements arising out of death claims, subdivided into payee and nonpayee elections; (3) life income settlements arising out of maturities and surrenders; and (4) matured deferred annuity contracts issued in the United States and Canada during the years 1931-75, inclusive.

INDIVIDUAL IMMEDIATE ANNUITIES

As in earlier studies, the ratios of actual to expected mortality are generally lower (a) in the first five contract years than later, (b) at the older attained ages than at the younger, (c) at annual incomes of \$2,500 and over than at annual incomes of under \$2,500, and (d) by amounts of annual income than by number of contracts.

Compared with 1967-71, reductions in mortality ratios were observed for all male business and nonrefund female business. Ratios under female refund annuities remained approximately the same. Females exhibited generally lower mortality ratios than males. Ratios under nonrefund annuities were generally lower than those under refund annuities.

The current study includes for the first time a division of immediate annuity experience into pension trust issues and other than pension trust issues. In general, pension trust mortality ratios substantially exceed those for other than pension trust.

LIFE INCOME SETTLEMENTS AND MATURED DEFERRED ANNUITIES

Under life income settlements arising from death claims, the relative proportions of exposure under payee and nonpayee elections remained approximately the same as in the previous study. Under refund life income settlements arising from maturities and surrenders, the portion of experience under pension trust issues has declined from that of the previous study.

Mortality ratios under life income settlements have, in general, decreased since the previous study. Male ratios exceed female ratios, and the ratios decrease with advance in age. Under refund settlements arising from death claims, mortality ratios under payee elections are generally lower than those under nonpayee elections. Under settlements arising from maturities and surrenders, ratios for other than pension trust issues were lower than those under pension trust issues among male lives. For females, the overall ratios under pension

trust issues are at about the same level as those under other than pension trust issues.

Under matured deferred annuities, the ratios at the early durations (1-5) have decreased, while those at the later durations (6 and over) have increased since the previous study. In general, female ratios are lower than male ratios, ratios by amounts of annual income are lower than those by number of contracts, and ratios under other than pension trust issues are lower than those under pension trust issues.

The current study continues the analysis by size of annuity begun in the previous study. The experience has been separated into contracts with amounts of annual income of less than \$2,500 and those with annual incomes of \$2,500 or greater. Under both life income settlements and matured deferred annuities, the ratios at annual incomes of \$2,500 and over are higher.

The current study includes, for the first time, an analysis by issue-year group: issues of 1960 and later were separated from issues of 1959 and prior. The analysis is by amount of annual income. Among the older issues, the level of mortality for amounts of annual income over \$2,500 is quite close to the overall level. Among later issues, the higher-income group exhibited higher mortality ratios.

INDEX OF TABLES

INDIVIDUAL IMMEDIATE ANNUITIES

Table	Description
1-2	<i>Nonrefund Annuities</i> by Attained Age, Contract-Year Groups, and Sex, Based on (1) α -1949 Ultimate Table and (2) 1971 IAM Table

MATURED DEFERRED ANNUITIES

Table	Description
29-30	<i>Matured Deferred Annuities</i> , Refund Pension Trust and Other Issues and Nonrefund Other Issues, by Age and Duration Groups, for (29) Male Lives and (30) Female Lives, Based on 1971 IAM Table
31	<i>Refund and Nonrefund Matured Deferred Annuities</i> , Pension Trust and Other Issues, by Sex, Based on 1971 IAM Table
32-35	<i>Trends under Matured Deferred Annuities</i> , Other than Pension Trust Issues, by Attained-Age and Duration Groups, Based on α -1949 Ultimate Table for (32) Nonrefund Annuities—Male Lives, (33) Nonrefund Annuities—Female Lives, (34) Refund Annuities—Male Lives, and (35) Refund Annuities—Female Lives
36	<i>Refund Matured Deferred Annuities</i> , Issues of 1960-65 and Issues of 1931-59, by Income Groups and Sex, Based on 1971 IAM Table
37	<i>Refund and Nonrefund Matured Deferred Annuities</i> , Pension Trust and Other Issues, by Size of Annuity and Sex, Based on 1971 IAM Table

COMPARISONS

Table	Description
38	<i>Comparison of Contracts with Guaranteed Period or Refund Provision, by Attained Age, Duration Groups, and Sex, Based on 1971 IAM Table, of: (A) Payee Elections from Death Claims, (B) Life Income Settlements from Maturities and Surrenders (Other than Pension Trust), (C) Matured Deferred Annuities (Other than Pension Trust), and (D) Individual Immediate Annuities (Other than Pension Trust)</i>
39	<i>Comparison of Pension Trust Issues with Guaranteed Period or Refund Provision, by Attained Age, Duration Groups, and Sex, Based on 1971 IAM Table, of: (A) Life Income Settlements from Maturities and Surrenders, (B) Matured Deferred Annuities, and (C) Individual Immediate Annuities</i>
40	<i>Comparison of Pension Trust, Qualified Non-Pension Trust, and Non-qualified Annuities under Life Income Settlements from Maturities and Surrenders and Matured Deferred Annuities, Based on 1971 IAM Table</i>

Appendix
Table

- A *List of Contributing Companies* with Proportions of Exposure Contributed by Each Company
- B *Exposures and Deaths under Immediate Annuities*: Number of Contracts and Amount of Annual Income, by Sex, Contract-Year Groups, and Type of Annuity
- C *Distribution of Companies' Aggregate Mortality Ratios*, by Number of Companies
- D *Refund and Nonrefund Immediate Annuities*, Pension Trust and Other Issues: *Exposures, Actual and Expected Deaths, and Mortality Ratios*, by Attained-Age Groups, Contract Years, and Sex
- E *Refund Life Income Settlements from Death Claims*, Payee and Nonpayee Elections: *Exposures, Actual and Expected Deaths, and Mortality Ratios*, by Attained-Age Groups, Duration, and Sex
- F *Refund Life Income Settlements from Maturities and Surrenders*, Pension Trust and Other Issues: *Exposures, Actual and Expected Deaths, and Mortality Ratios*, by Attained-Age Groups, Duration, and Sex
- G *Refund and Nonrefund Matured Deferred Annuities*, Pension Trust and Other Issues: *Exposures, Actual and Expected Deaths, and Mortality Ratios*, by Attained-Age Groups, Duration, and Sex
- H *Nonrefund Life Income Settlements*; Settlements from Death Claims, Payee and Nonpayee Elections; Settlements from Maturities and Surrenders, Pension Trust and Other Issues: *Exposures, Actual and Expected Deaths, and Mortality Ratios*, by Attained-Age Groups, Duration, and Sex

A. INDIVIDUAL IMMEDIATE ANNUITIES

Introduction

THIS section of the report examines mortality between 1971 and 1976 contract anniversaries under individual immediate annuities issued in 1931-75. The previous report (*TSA, 1973 Reports*, p. 59) covered mortality experience from 1967 to 1971 contract anniversaries. Both refund and nonrefund annuities are included. Contracts providing for either cash or installment refund payments and annuities with a period certain are classified as refund annuities. The types of annuities excluded are the same as those in earlier studies (variable annuities as well as those listed in *TSA, 1964 Reports*, p. 80).

The study is on an attained-age basis, with attained age defined as age at issue plus contract year minus one. Age at issue is taken as the age nearest birthday on the issue date of the contract, or some reasonable approximation to that age.

Experience is reported by the use of ratios of actual to expected deaths. Expected deaths are based on the Annuity Table for 1949 Ultimate without projection and on the 1971 Individual Annuity Mortality Table. For each of these tables, separate expected death rates are used for males and females. The α -1949 Ultimate Table with Projection B, which had been used in previous studies, was not used in the calculation of expected deaths.

Previous studies are listed below:

- 1948-53 anniversaries—*TSA, 1954 Reports*, pp. 36-61
- 1953-58 anniversaries—*TSA, 1959 Reports*, pp. 67-102
- 1958-63 anniversaries—*TSA, 1964 Reports*, pp. 80-99
- 1963-67 anniversaries—*TSA, 1969 Reports*, pp. 5-62
- 1967-71 anniversaries—*TSA, 1973 Reports*, pp. 59-126

Table A of the Appendix contains the names of the fifteen contributing companies and their proportionate contributions to the experience based on amounts of annual income. Six past contributors did not provide data for the current study. For the most part, there does not appear to be any distortion in the overall results because of the changes in contributors. Table C of the Appendix shows the distribution of the contributing companies' aggregate mortality ratios by number of companies.

The present study is based on exposures of 612,356 contract years and \$547,003,974 annual income years; 35,000 contracts involving \$25,598,318 of annual income were terminated by death. Compared with the previous four-year study, the current five-year study shows an increase of 29

percent in the exposure by contract years and an increase of 58 percent in the exposures by amounts of annual income. The larger increase by amounts of annual income largely reflects the effect of monetary inflation.

An analysis of the exposures and deaths by sex, type of annuity, and contract-year group is given in Table B of the Appendix. Refund annuities accounted for 74 percent of the total exposures by amounts of annual income (as opposed to 63 percent in the previous study). Annuities on females accounted for about 60 percent of the total exposures by amount of annual income, compared with 63 percent in the previous study.

The accompanying table presents average amounts of annual income

AVERAGE AMOUNT OF ANNUAL INCOME UNDER
INDIVIDUAL IMMEDIATE ANNUITIES
DERIVED FROM FIRST-CONTRACT-YEAR EXPOSURES
IN LAST FIVE INTERCOMPANY STUDIES

EXPERIENCE	NONREFUND		REFUND	
	Male	Female	REFUND	
			Male	Female
1953-58	\$ 760	\$ 507	\$ 529	\$ 427
1958-63	903	849	779	659
1963-67	1,403	1,150	1,126	967
1967-71	1,600	1,247	1,278	1,020
1971-76	1,674	1,577	1,593	1,289

derived from first-contract-year exposures in the five most recent intercompany studies. In the current study, as in prior studies, there has been an increase in this average amount in all four refund-sex categories, although the increase in male nonrefund annuities was modest. In comparing the 1967-71 and 1971-76 studies, it is important to note that the current study includes the experience under refund annuities of a large company that the previous study did not. For this company, the portion of its total exposure under refund annuities and the average amount of annual income among first-year exposures both exceed the "all companies" average.

Details of the current study concerning exposures, actual deaths, and expected deaths (1971 IAM) are contained in Table D of the Appendix.

*Experience in Relation to α -1949 Ultimate Table
and 1971 IAM Table*

Tables 1-4 present attained-age mortality ratios, for nonrefund and refund annuities separately, based on the α -1949 Ultimate Table and

the 1971 Individual Annuity Mortality Table. The main features of the 1971-76 experience are the following:

1. As in the previous study, the mortality ratios on the α -1949 Ultimate at attained ages 60 and over for all contract years combined are generally less than 100 percent. The ratios tend to be level or decreasing with advance in age, the sharpest drop occurring between the attained-age groups 50-59 and 60-69. Male ratios are generally higher than female ratios.
Aggregate mortality ratios on the 1971 IAM are generally over 100 percent except at attained ages 90 and over. All overall ratios for contract years 1 and 2 combined are less than 100 percent (except for male refund by amounts of annual income).
2. In general, the ratios for all ages combined increase with contract year. Self-selection appears to be greater for females than for males and greater in the case of nonrefund annuities than refund annuities. This is most apparent in the early contract years, where female ratios are particularly low. The previous study noted a select period of three to five years for males and of at least ten years for females. The mortality ratios of the current study indicate a select period of at least ten years for females and at least five years for males.
3. Ratios by amounts of annual income are generally lower than those by number of contracts.
4. Ratios under nonrefund annuities are generally lower than those under refund annuities.

Experience by Size of Annuity

Tables 5-8 present mortality ratios for nonrefund and refund annuities separately, analyzed by amounts of annual income. In each table, the overall mortality ratios for annual incomes of \$2,500 and over are lower than the ratios for all income levels combined. There does not appear to be any significant variation in the ratios by annual income group.

Pension Trust Experience

Tables 9 and 10 present, for the first time, an analysis of pension trust experience under immediate annuities. There was not sufficient experience to include an analysis by contract year, and, hence, the tables were prepared on an aggregate basis. Table 9 shows ratios by attained age and sex and Table 10 by income group and sex.

The ratios for pension trust issues are, in general, significantly higher than for other than pension trust issues.

Comparison with Previous Studies

A comparison of experience under individual immediate annuities for successive periods between 1948 and 1976 anniversaries is presented in

Tables 11–14. The tables show mortality ratios based on the a -1949 Ultimate Table for all years of issue and on the 1971 IAM Table for issues of 1967 and later.

Previous studies have computed “all-ages adjusted” mortality ratios to compensate for changes in the distribution of exposures by attained age and duration from the earlier to the later periods. These adjustments have been continued in the current study, but their impact on the all-ages mortality ratio is slight, and we expect to omit these adjustments in future studies.

The following comments are based on Tables 11–14, using the a -1949 Ultimate Table:

Male nonrefund.—The all-ages ratios in each contract-year group decreased from those in the 1967–71 study. The ratios based on amounts of annual income decreased considerably both for contract years 1–5 and for years 6 and over, while ratios based on number of contracts decreased significantly only for years 6 and over.

The overall ratio is lower, by number and by amount, than in any previous study. The greatest reductions occurred at ages 70 and over.

Female nonrefund.—Mortality ratios have decreased substantially since the 1967–71 period, following a modest decline from the 1963–67 period to the 1967–71 period. Most of the reduction in mortality was at ages 80 and over.

Male refund.—Overall mortality ratios have decreased substantially both by number of contracts and amounts of annual income, with significant decreases occurring for most ages and durations.

Female refund.—There was little difference from the previous study in the overall mortality ratios. However, for contract years 1–5, ratios generally decreased by number of contracts and increased by amounts of annual income. For years 6 and over, the ratios have not changed much between the two periods.

Experience on Issues of 1960–65 and Issues of 1931–59

In the previous study, a separation of the experience into two issue-year groups—1959 and prior, and 1960 and later—was made to permit a monitoring of experience on issues of 1960 and later in response to the rise in average amounts of annual income purchased during the later 1950s and the early 1960s. Table 15 presents a comparison of the two issue-year groups for refund and nonrefund experience. The table shows *ultimate* experience only, so that the results will be more comparable.

Under nonrefund annuities, the mortality ratios by amounts of annual income exceed those by number of contracts for issues of 1931–59 (Group 1) for both males and females. For issues of 1960–65 (Group 2), the ratios by number of contracts exceed those by amounts of annual income for

both sexes. It seems that self-selection by healthy lives is more prevalent among recent issues than among older ones. However, the level of mortality for Group 1 is generally lower than that for Group 2 and is considerably lower than that reported in the previous study for the same issue years. Perhaps there has been a distortion in the analysis resulting from a change in the number of contributors to the current study from the previous one. For Group 2, the highest ratio occurred in the income group \$5,000-\$7,499 for both males and females. The data for this income group are, however, rather limited.

Under refund annuities, the ratios for Group 2 are, in general, lower than those for Group 1 for both sexes. In each income group, where there was a significant amount of data, the male ratios are higher than the female ratios, in both issue-year periods.

B. LIFE INCOME SETTLEMENTS AND MATURED DEFERRED ANNUITIES

Introduction

This section of the report covers the intercompany experience under the following three major categories of contracts between 1971 and 1976 anniversaries:

1. Life income settlements arising out of death claims, subdivided into
 - a) Payee elections
 - b) Nonpayee elections.
 Experience arising from unknown elections has been excluded.
2. Life income settlements arising out of (a) the maturity of endowment or retirement income policies or (b) the cash surrender of insurance or annuity contracts.
3. Maturities of deferred annuity contracts, including maturities at optional retirement dates, with a death benefit prior to maturity and a cash value at maturity substantially equal to the reserve.

Categories 1 and 2 include settlements that are regarded as supplementary contracts, even though they may have a rate basis applicable to new annuity issues. In the past, single-life settlements arising from the maturity or surrender of the original contract by the person insured were included in the study only if the insured had the option of electing a single-sum settlement equal to the full present value of the life income. This has been changed, and, in the current study, the settlement has been included even if the insured did not have such an option, provided that the policy was issued under a pension trust contract.

The limited data on nonrefund contracts precluded making the more extensive analyses made on refund contracts. Accordingly, only brief summaries are shown, comparing nonrefund and refund settlements in the aggregate.

Previous studies are listed below:

- 1945-50 anniversaries—*TSA, 1951 Reports*, pp. 19-71
- 1950-55 anniversaries—*TSA, 1956 Reports*, pp. 37-109
- 1955-60 anniversaries—*TSA, 1961 Reports*, pp. 40-82
- 1960-65 anniversaries—*TSA, 1966 Reports*, pp. 191-247 (supplement)
- 1965-70 anniversaries—*TSA, 1972 Reports*, pp. 57-161

Table A of the Appendix shows the names of the fifteen contributing companies and their proportionate contributions. Table C of the Ap-

pendix shows the distribution of the contributing companies' aggregate mortality ratios by number of companies.

Life Income Settlements Arising from Death Claims

The exposures, actual deaths, and expected deaths are shown in Table E of the Appendix for refund settlements and in Table H for nonrefund settlements.

Tables 16 and 17 present mortality ratios on the 1971 IAM Table under refund settlements by attained-age and duration groups for males and females, respectively; payee and nonpayee elections are shown separately. For male lives, 36 percent of the total exposure (by amounts of annual income) is under payee elections and 64 percent is under nonpayee elections (as opposed to 35 percent and 65 percent in the previous study).

Table 16 shows that, in general: (i) the ratios under payee elections are lower than those under nonpayee elections, (ii) under payee elections

the ratios by amounts of annual income are lower than those by number of contracts, and (iii) under nonpayee elections the ratios by amounts of annual income are higher than those by number of contracts. These relationships were observed also in the previous study.

For female lives, 42 percent of the exposure by amounts of annual income is under payee elections and 58 percent is under nonpayee elections (as opposed to 43 percent and 57 percent, respectively, in the previous study). In Table 17 the ratios under payee elections are generally lower than those under nonpayee elections, except at ages 90 and over. Payee elections show considerable self-selection by amounts of annual income (i.e., lower mortality ratios by amounts of annual income than by number of contracts) at the early durations. Apart from duration group 1-2, however, the ratios by number of contracts and by amounts of annual income are fairly close under both types of elections.

Table 18 shows that the volume of experience under nonrefund settle-

ments is small relative to that under refund settlements. The overall ratios for nonrefund settlements are generally lower than those under refund settlements, as expected. However, under nonrefund settlements, nonpayee elections exhibit ratios that are lower than those under payee elections. The ratio by amounts of annual income under male nonrefund nonpayee elections is particularly low.

Life Income Settlements Arising from Maturities and Surrenders

The exposures, actual deaths, and expected deaths are shown in Table F of the Appendix for refund settlements and in Table H for nonrefund settlements.

The portion of total exposure by amounts of annual income under pension trust issues has declined since the most recent study. Under refund settlements, they are 18 percent of the total, down from 20 percent, while under nonrefund settlements, they are 7 percent of the total, down from 22 percent.

Tables 19 and 20 present mortality ratios on the 1971 IAM Table for refund settlements, on pension trust and other than pension trust issues, respectively, by sex. The overall ratios (all ages and durations combined) were each over 100 percent, male ratios significantly exceeding female ratios.

Table 19 shows that, for male lives, the general level of mortality under other than pension trust issues is much lower than that under pension

Nonpayee elections.....	138 (307)	111 (7,816)	141	110
Without a guaranteed period or refund provision:				
Payee elections.....	109 (48)	94 (525)	127	97
Nonpayee elections.....	89 (27)	82 (503)	64	84

NOTE.—Number of contracts terminated by death shown in parentheses.

trust issues. The overall ratios by age and duration are generally over 100 percent for both pension trust and other than pension trust issues. However, the relatively low mortality ratios for durations 1-2 indicate considerable self-selection. Under pension trust issues, ratios by number generally exceed those by amount; for other than pension trust issues, those by number are lower.

Table 20 shows that the pattern of female mortality is somewhat different. For females there is very little difference in the overall ratios (i) between pension trust and other than pension trust issues and (ii) between those by number of contracts and those by amounts of annual income. However, as for males but even more significantly so, female mortality ratios for durations 1-2 indicate considerable self-selection.

Table 21 presents a summary of male and female experience comparing refund and nonrefund settlements under maturities and surrenders. Under other than pension trust issues, the level of mortality on nonrefund

NOTE.—Number of contracts terminated by death shown in parentheses.

settlements is close to that under refund settlements for both males and females. Under pension trust settlements the level under nonrefund settlements is higher than that under refund settlements.

Tables 22-25 summarize mortality ratios under refund settlements in broad age and duration groups for each of the last six study periods. Pension trust issues were excluded from the experience after 1950; the increasing importance of these issues and the different pattern of mortality experienced under them would obscure the trends. It was not possible to exclude the experience prior to 1950 under pension trust issues, but the experience was so small that its effect is negligible. Payee and nonpayee elections are shown separately; the experience on payee elections combines settlements arising from death claims and maturities and surrenders.

Under male payee elections (Table 22), the overall mortality ratios at durations 1-5 have decreased since the previous study, while those at durations 6 and over have remained nearly level. In fact, the overall mortality ratios for durations 6 and over have remained nearly level since the 1960-65 period, both by number and amount. For durations 1-5, the ratio by number has decreased steadily since 1960-65, but that by amount is now at the same level as in 1960-65.

Overall mortality ratios under female payee elections (Table 23) have decreased for both duration groups by number of contracts and by amounts of annual income. This has been the pattern for all studies presented in the table. By attained age, the trend has been definitely downward for ages 60 and over both by number and amount, while for ages under 60 the sequence is rather irregular.

Substantial decreases in the overall male nonpayee election mortality ratios have occurred since the previous study (Table 24). At durations 6 and over, the decrease has been dramatic at ages 60-69, both by number of contracts and by amounts of annual income.

There has been a slight decrease in the overall mortality ratios under female nonpayee elections since the previous study (Table 25). However, the mortality ratios for ages under 60, both by number and amount, in this and the previous study have generally been greater than those in prior studies.

Analysis by Issue-Year Group

Table 26 presents a division of the ultimate experience into two issue-year groups, 1931-59 (Group 1) and 1960-65 (Group 2), similar to that for immediate annuities (Table 15, in Sec. A on immediate annuities). The table presents mortality ratios by income groups under refund settle-

ments only, for payee elections arising from death claims and for maturities and surrenders (excluding pension trust issues) combined. The experience under nonrefund settlements was too limited to permit such an analysis. The table shows that, for issues of 1931–59, the ratios at annual incomes of \$2,500 and over are generally less than overall ratios. For issues of 1960–65, the ratios for annual incomes of \$2,500 and over are substantially greater than the overall ratios.

Mortality by Size of Annuity

Tables 27 and 28 present an analysis of the experience by income group. The tables present mortality ratios for all ages and durations combined, separated into annual income groups of less than \$2,500, and \$2,500 and over. The number of deaths in each cell appears in parentheses next to the mortality ratio.

Under life income settlements arising from death claims (Table 27), the male experience at annual incomes of \$2,500 and over is too limited

to afford any meaningful comparison with the lower-income group. For females the two income groups are not significantly different except in the case of nonrefund payee elections, where the higher-income group exhibits a higher mortality ratio.

Under maturities and surrenders (Table 28), the male ratios for other than pension trust issues are greater for incomes of \$2,500 and over than for \$2,500 and under. For females under refund settlements the \$2,500 and over income group exhibits higher ratios than the under \$2,500 group, for both pension trust and other than pension trust issues; the reverse is true for females under nonrefund settlements.

Matured Deferred Annuities

Exposures, actual deaths, and expected deaths are shown in Table G of the Appendix. The primary features of the exposure are as follows: males accounted for 46 percent of the exposure by amounts of annual income (up from 44 percent in the previous study). For male lives, 23 percent of the exposure is under pension trust issues and 88 percent of the exposure is under refund annuities. For female lives, 3 percent of the exposure is under pension trust issues and 73 percent is under refund annuities.

Table 29 presents mortality ratios on the 1971 IAM Table for male lives under refund annuities, both pension trust and other than pension trust issues, and under nonrefund other than pension trust issues. By number of contracts, the sequences of mortality ratios for refund annuities indicate a select period of perhaps two years. The level of pension trust mortality is higher than for other than pension trust issues as expected, but the overall pattern by duration is rather similar. The volume of data for nonrefund other than pension trust issues is too limited to permit an analysis by duration. However, the ultimate mortality ratios and aggregate ratios are quite close to those exhibited by refund other than pension trust issues. Generally, the lowest aggregate ratios occur at ages 90 and over.

Table 30 presents mortality ratios for females that are comparable to those of Table 29. Under refund other than pension trust issues, the sequence of ratios by contracts (all ages combined) indicates a select period of about five years. Under pension trust, mortality ratios generally decrease with duration; also, the aggregate ratios decrease substantially with advance in age—suggesting that the health of the annuitants at retirement was impaired. As is true for males, the overall level of mortality

for females under other than pension trust issues is approximately the same for refund as it is for nonrefund settlements.

Table 31 compares the overall ratios of refund and nonrefund matured deferred annuities under pension trust and other than pension trust issues for male and female lives. For refund and nonrefund issues, the level of mortality on pension trust is generally higher than that under other than pension trust. Ratios by number of contracts are similar to those by

ence prior to 1950 under pension trust issues, but the effect of their inclusion is minimal.

Male nonrefund (Table 32).—The overall ratios have increased since the previous study, except for durations 1–5 by amounts of annual income. In this category the decrease was substantial and the ratio is rather low (54 percent). The overall ratios, all ages and durations combined, are at the same level as in 1955–60 and 1960–65, by number and amount, of about 90 percent.

Female nonrefund (Table 33).—The all-ages ratios have increased in all categories since the previous study. As for males, the increases in aggregate ratios by amounts of annual income reflect increases at ages 70 and over; the ratios by amount generally decreased at ages 60–69.

Male refund (Table 34).—The overall ratios by amounts of annual income decreased slightly. By contracts, there was a decrease at durations 1–5 (due to a large reduction at ages 60–69) but an increase at durations 6 and over.

Female refund (Table 35).—At durations 1–5, the ratios by contract and by amounts of annual income decreased—rather substantially at ages 70 and over. At durations 6 and over, the ratios increased. The net overall effect was a small increase by amount and a somewhat larger increase by number of contracts.

Analysis by Issue-Year Group

Table 36 presents an analysis of the ultimate experience by issue-year groups, analogous to that presented for immediate annuities and life income settlements. The analysis separates issues of 1931–59 (Group 1) from those of 1960–65 (Group 2). The table presents ratios only for refund

other than pension trust issues, because (i) the mortality of pension trust issues is significantly different from that of other than pension trust issues, hence combining them would be inappropriate, and (ii) the pension trust experience is largely at amounts of annual income under \$2,500, making an analysis by income group of limited value.

For male lives, the overall Group 2 ratios are lower by number of contracts and higher by amounts of annual income than the Group 1 ratios. Also, the Group 2 ratios at annual incomes of \$2,500 and over are significantly higher than the Group 1 ratios, both by number of contracts and by amounts of annual income. For females, the experience is largely at annual incomes of under \$2,500, where, in each income group except "unknown," the Group 2 ratios are higher than the Group 1 ratios. For Group 2 the male and female overall ratios by contract are the same, but the male ratio by amount significantly exceeds the female ratio.

NOTE.—Mortality ratio in italics where 10-49 contracts terminated by death.

* Fewer than 10 contracts terminated by death.

Analysis by Size of Annuity

Table 37 analyzes mortality ratios by size of annuity, based on amounts of annual income. The format is the same as that of Tables 27 and 28 under life income settlements. The volume of data is too limited in most categories to permit the drawing of any firm conclusions. In general, the ratios at annual incomes of \$2,500 and over are greater than those at under \$2,500.

Comparison of Life Income Settlements, Matured Deferred Annuities, and Immediate Annuities

Table 38 compares the experience of (A) life income settlements arising from death claims (payee elections), (B) life income settlements arising from maturities and surrenders, (C) matured deferred annuities, and (D) immediate annuities. Experience under pension trust issues has been excluded from the table. Only annuities with a guaranteed period or refund provision have been included.

The aggregate ratios for females vary relatively little among the various types of annuities. Within the various duration groups, there is variation among the different types of annuities, but the relationships change with

change in duration group and tend to offset each other. For males the aggregate immediate annuity ratios at the earlier durations (durations 1–10) are significantly lower than those for life income settlements and matured deferred annuities, both by number and amount. (Payee election data for males are somewhat limited.) The lowest female ratios in the early durations also occur under immediate annuities. In the ultimate period (durations 11 and over), the lowest ratios occur under payee election life income settlements.

Table 39 compares the mortality ratios of pension trust issues under (A) life income settlements arising from maturities and surrenders, (B) matured deferred annuities, and (C) immediate annuities, all with a guaranteed period or refund provision. The following comments pertain to both males and females. In general, the highest ratios occur under matured deferred annuities. At durations 1–5 the lowest ratio occurs under life income settlements, and at durations 6–10 it occurs under immediate annuities. At durations 11 and over, immediate annuities exhibit the lowest ratios for male lives, while life income settlements are lowest for females.

Analysis by Tax-qualified Status

The current study includes a more refined analysis of the category "other than pension trust issues" than has been included in previous studies. The Committee's instructions called for this category to be broken down into *four* components in the case of immediate and matured deferred annuities and *five* components in the case of life income settlements. These categories are as follows: (i) nonqualified annuities, (ii) H.R. 10 annuities, (iii) tax-sheltered annuities, (iv) individual retirement annuities, and, under life income settlements, (v) vested-registered contracts. There was insufficient experience in categories ii–iv under immediate annuities for this type of analysis. For life income settlements and matured deferred annuities, the extent of the data permits an analysis of refund issues only, with durations grouped and all ages combined.

Accordingly, Table 40 presents mortality ratios under life income settlements and matured deferred annuities for the following categories: pension trust issues, nonqualified annuities, and qualified non-pension trust annuities. Under matured deferred annuities, qualified non-pension trust includes categories ii–iv listed above, and under life income settlements, categories ii–v.

Nonqualified annuities represent the greater part of other than pension trust issues. Thus, a direct comparison of pension trust issues with non-qualified annuities essentially would duplicate the comparisons of pen-

sion trust issues with other than pension trust issues of Tables 19-20 and 29-30. Also, the vast majority of deaths and exposures under qualified non-pension trust issues occur at durations 1-10. Therefore, all ratios in Table 40 are based solely on the experience of durations 1-10. The table shows that the level of mortality among male and female lives under qualified non-pension trust issues is substantially lower than that under the other types of annuities.
