## TRANSACTIONS OF SOCIETY OF ACTUARIES 1984 REPORTS

## II. MORTALITY UNDER STANDARD ORDINARY INSURANCE ISSUES BETWEEN 1984 AND 1985 ANNIVERSARIES

ABSTRACT
This study is the latest in a series of annual reports on intercompany mortality experience under Standard Ordinary life insurance policies. Because of differences in contributors, comparisons with previous studies are affected.

Mortality ratios based on the 1975-80 Basic Tables are shown in the body of the report. Mortality ratios based on the 1965-70 Basic Tables also are shown for comparison with previous reports.

A general direct comparison with the previous study (between 1983 and 1984 anniversaries) shows the following results using mortality ratios based on the 1975-80 Basic Table:

- The overall medical mortality ratio in the select period ( 90.5 percent) was down from 93.6 percent.
- The overall nonmedical mortality ratio in the select period ( 92.5 percent) increased by almost 3 percentage points from 89.6 percent. This was the first increase after continual decreases (on the 1965-70 Select Basic Table) since the 1972-73 experience.
- The overall paramedical mortality ratio in the select period ( 94.3 percent) increased about 2 percentage points from 92.2 percent.
- the overall mortality ratio in the ultimate period (91.1 percent) decreased from 91.8 percent.
- The combined medical, paramedical, and nonmedical select experience was 68.5 percent on the 1965-70 Select Basic Table and 91.9 percent on the 1975-80 Select Basic Table.

In the select period, for all policy years combined, nonmedical mortality was significantly higher than medical mortality for issue ages $25-29$ and 35 and above.

In the ultimate period, nonmedical mortality exceeded medical mortality for the attained age groups below 25 and at 40 and over.

As has been true in the past, overall mortality on premium-paying insurance was slightly lower than that on fully paid-up insurance.

Comparisons of male and female mortality were made for experience between 1980 and 1985 anniversaries. In the select period, female mortality averaged 72.4 percent of male mortality for medical issues, 56.2 percent for
nonmedical issues, and 69.0 percent for paramedical issues (1981-85 anniversaries). In the ultimate period, female mortality was 62.3 percent of male mortality.

A comparison of smoker and nonsmoker experience is included based on contributions of 14 companies. Smoker mortality rating was more than double those for nonsmokers for medical ( 180.3 percent versus 84.1 percent) and paramedical issues ( 164.5 percent and 63.0 percent). The nonmedical smoker ratio was 115.9 percent, compared to 63.8 percent for nonsmokers.

Index of Primary Tables

| Tabit | Exposure Period | Policy Years | Medical. Nonmedical, of Paramedical | Male and Female | Moralify Ratios by | Mortality Ratios Based on: |

## INTRODUCTION

This report covers the intercompany (U.S.) mortality experience under Standard Ordinary insurance between 1984 and 1985 policy anniversaries. The report also shows combined experience between 1980 and 1985 policy anniversaries in order to have sufficient experiences for more detailed analysis for certain comparisons of data. The following classes of business are included:

1. Standard Ordinary insurance issued subject to a medical examination, observed during the first 15 policy years;
2. Standard Ordinary insurance issued without a medical or paramedical examination, observed during the first 15 policy years;
3. Standard Ordinary insurance issued subject to a paramedical examination, observed during the first 15 policy years;
4. Standard Ordinary insurance observed during the sixteenth and subsequent policy years. As in previous reports, this ultimate experience is shown for medical and nonmedical issues combined, with a portion of it also shown for medical and nonmedical issues separately. The ultimate experience also is shown separately for premium-paying and fully paidup (excluding reduced paid-up) policies.
Each of the tables included in this report (with some minor exceptions) shows amounts exposed to risk, actual amounts of death claims, and expected amounts of death claims and mortality ratios of actual to expected death claims based on the 1975-80 Male and Female Basic Tables and on the 1965-70 Basic Tables. All the data were submitted separately for males and females in the select period; some of the data were submitted on a combined male-female basis in the ultimate period.

The 1984-85 experience is derived from the contributions of 23 companies. Table A of the Appendix gives the names and proportionate contributions of these companies. Each of the tables is based on either select (first 15 policy years) or ultimate (policy years 16 and subsequent) experience.

The two tabulations on page 28 compare relative percentages of exposures by underwriting category in policy year one for several years of issue and the distribution of exposures by underwriting category for the different groups of ages at issue for policy year 1 and years 1-15.

Exposures for Policy Year 1
As a Percentage of Total Exposures

| Year of Issue | Medical | Nonmedical | Paramedical |
| :---: | :---: | :---: | :---: |
| 1977 | $34.7 \%$ | 36.4\% | 28.9\% |
| 1978 | 35.1 | 36.4 | 28.5 |
| 1979 | 35.1 | 34.4 | 30.5 |
| 1980 | 38.2 | 29.3 | 32.5 |
| 1981 | 33.1 | 36.3 | 30.6 |
| 1982 | 29.2 | 45.7 | 25.1 |
| 1983 | 24.7 | 51.8 | 23.5 |
| 1984. | 22.5 | 52.2 | 25.3 |

Exposures As a Percfinhoe of Total Exposlres (1984-85 Experience)

| Ages Issue | Medical |  | Sonmedical |  | Paramedical |  |

| Pcrcentage points below average: |  |  |
| More than 15............. | 1 | 1.0\% |
| 10-15. | 3 | 12.9 |
| 5-10. | 4 | 18.2 |
| 0-5. | 3 | 10.3 |
| Percentage points above average: |  |  |
| 0-5......................... | 4 | 16.1 |
| 5-10................. | 3 4 | 22.5 |
| 10-15 . . . . . . . . . . . . . . . . | 4 | 17.5 1.4 |

It would be desirable for the comparisons of medical, nonmedical, and paramedical experience to be based on strictly comparable policies, but data for such comparisons are not available. Medically underwritten business generally includes larger amounts of insurance issued to persons at higher average socioeconomic levels than nonmedical and paramedical business. However, medical business also includes policies issued to individuals within nonmedical or paramedical amount limits who were not acceptable on those
bases because of medical histories. Similarly, paramedical policies include persons not acceptable on a nonmedical basis. In addition, there are considerable variations in limits and proportions of medical, nonmedical, and paramedical policies among contributing companies. Note also that in this report the different mix of companies from those in previous studies may account for some of the differences in the mortality ratios.

EXPERIENCE LNDER STANDARD ISSUES<br>DURING THE FIRST 15 POLICY YEARS

## Medically Examined Issues

The 1984-85 experience during the first 15 policy years includes exposures of $\$ 206$ billion and actual deaths of $\$ 548$ million. The corresponding amounts in the 1983-84 experience were $\$ 214$ billion and $\$ 567$ million. respectively.

The experience by age group at issue is shown in Table 1 for the first 15 policy years combined. The experience by year of issue is shown in Table 2. The detailed experience by age group at issue for each year of issue, for male and female lives separately, is not shown in this report but is available from the Society Research Department upon request for a nominal charge for duplication and mailing.

| All years of issue $\qquad$ |  | \$205,815,227 | \$548,094 | \$827,479 | $66.2 \%$ | \$605,551 | 90.5\% |

The aggregate medical mortality ratio for the period from 1984 to 1985 anniversaries was 90.5 percent on the 1975-80 Select Basic Tables. The 1984-85 result is a decrease of 3.1 percentage points from the general mortality level of the 1983-84 study for male and female lives combined. For female lives the mortality ratios decreased from 120.1 percent to 103.5 percent on the 1975-80 Basic Tables. The exposure for female lives was relatively small (about $\$ 25$ billion compared to $\$ 181$ billion for male lives). Compared to the 1983-84 experience, the female exposures were only slightly less, but actual deaths were down from $\$ 67$ million to $\$ 59$ million. The single most significant change was at issue ages $65-69$ where actual deaths and the mortality ratio fell from $\$ 9.6$ million and 262 percent in 1983-84 to $\$ 3.2$ million and 77 percent in 1984-85, respectively.

## Nonmedical Issues

The 1984-85 experience during the first 15 policy years includes exposures of $\$ 321$ billion and actual deaths of $\$ 241$ million. The corresponding amounts in the 1983-84 study were $\$ 294$ billion and $\$ 207$ million, respectively.

As shown in the summary on page 28, the increase in the proportion of nonmedical business for the policy year was much less than in the previous three years.

The experience by age group at issue is shown in Table 3 for the first 15 policy years combined. The experience by year of issue is shown in Table 4. The detailed unadjusted experience by age group for each year of issue, for male and female lives separately, is not shown in this report but is available from the Society Research Department for a nominal charge.

TABLE 3
Standard Nonmedical Issues of 1970-84

The aggregate mortality ratio for the period from 1984 to 1985 anniversaries was 92.5 percent on the 1975-80 Select Basic Tables. As the summary of aggregate mortality ratios on page 29 shows, the overall nonmedical ratio (on the 1965-70 Select Basic Tables) increased for the first time since 197273.

The mortality ratios in Tables 3 and 4 generally understate the mortality ratios for nonmedical business because, in calculating the expected deaths, no adjustment has been made to allow for differences in the average age of the exposure in each nonmedical five-year age group compared with the average age of the exposure in the corresponding age group used in developing the Basic Tables. The 1975-80 Basic Tables were based on combined medical, nonmedical, and paramedical issues. Differences arise because companies typically change their nonmedical limits at ages $30,35,40$, and so on.

Nonmedical issues over age 50 arise largely from business issued under special circumstances such as pension trust and salary allotment plans. For
other policies, nonmedical limits extending to age 50 and in some cases even for limited amounts above age 50 have been introduced only in recent years. So-called policyholder's nonmedical, issued on the basis of a medical examination within the previous six to twelve months, is also included in nonmedical issues for some companies while for others in their medical or paramedical issues.

## Paramedically Examined Issues

The 1984-85 paramedical experience includes exposures of $\$ 169$ billion and actual deaths of $\$ 262$ million. The volume of paramedical business increased from exposures of $\$ 157$ billion and actual deaths of $\$ 218$ million in 1983-84. The limited experience at the higher durations should be noted carefully in comparisons with medical and nonmedical results.

The detailed experience by age group at issue is included in Table 5. The experience by year of issue is shown in Table 6.

| 1984 | 1 | 37,494,939 | 32,630 | 52,145 | 62.6 | 38,458 | 84.8 |
| All years of issue |  | \$169,118,942 | \$262,407 | \$375,195 | 69.9\% | \$278,387 | 94.3\% |

The aggregate paramedical mortality ratio for the period from 1984 to 1985 anniversaries was 94.3 percent on the 1975-80 Table. As the summary of aggregate mortality ratios on page 29 shows, the overall paramedical ratio increased compared to last year.

## Comparison of Medical and Nonmedical 1980-85 Experience

Table 7 presents the experience on medical and nonmedical select issues between 1980 and 1985 anniversaries. The nonmedical mortality ratios shown in Table 7 are based on the 1975-80 Basic Tables. They have not been ageadjusted to reflect the distribution of nonmedical exposures by age, which is likely to have a significant effect on issue-age groups $40-44$ and higher. Table 7 indicates that, for policy years 1 to 15 combined, nonmedical mortality was generally less than medical for issue ages 10 through 24 . A significant proportion of medical issues at these young ages includes persons who were not acceptable on a nonmedical basis because of medical histories.

## Comparison of Male and Female 1980-85 Experience

For the select period, each of the 23 contributing companies submitted medical, nonmedical, and paramedical data separately for males and females.

Tables 8 and 9 show the experience by sex and issue age group between 1980 and 1985 anniversaries for the first 15 policy years combined for standard medical and nonmedical issues, respectively. A new exhibit, Table 10, shows comparable data for standard paramedical issues for the four-year period 1981 to 1985 . For the purpose of comparing male and female mortality, the ratios of female to male mortality are based on expected deaths for females calculated on the male table. For all issue ages combined, the ratios of female to male mortality were 72.4 percent for medical issues, 56.2

*Female mortality ratios calculated on Male Select Basic Tables.
percent for nonmedical issues, and 69.0 percent for paramedical issues on the 1975-80 Select Basic Tables. The difference in favor of females on nonmedical issues reflects particularly the generally lower ratio of female to male mortality rates at younger ages, largely due to the higher accidental death rate for males. The detailed select experience by sex for the period from 1984 to 1985 policy anniversaries by age group at issue for each year of issue is available from the Society Research Department: Table B for medical issues, Table C for nonmedical issues, and Table D for paramedical issues.

Table 11 compares the experience between 1980 and 1985 anniversaries on medical and nonmedical issues, separately for each sex, for policy years $1-2,3-5,6-10,11-15$, and $1-15$ based on the 1975-80 Select Basic Tables. The nonmedical mortality ratios shown in Table 11 have not been adjusted to reflect the distribution of nonmedical exposures by age, which is likely to have a significant effect on issue age groups $40-44$ and over. For males, the ratios of the nonmedical to the medical mortality ratios were 100 percent or greater at all issue ages except 20-24 in policy years 1-15 combined. For females, the ratios exceeded 100 percent for issue ages $0-9$ and $25-29,35-$ 39 and 45 and over in policy years $1-15$ combined.

## Comparison of Smoker and Nonsmoker Experiences

Tables 1-6 were analyzed by using available smoker/nonsmoker data for the 14 companies that submitted any smoker/nonsmoker distinct data. Table 12 shows the available experience for durations $1,2,3,4$ and $5-15$ combined. The exposures by smoker and nonsmoker status are concentrated in the first three policy years. Nearly all the duration 1-4 medical and paramedical exposure for the companies is distinct by smoking status. But a substantial volume of nonmedical exposure is for smoking status unknown. Overall, the exposures for smokers are less than $25 \%$ of the exposures for nonsmokers. Tables by smoker status are available from the Society Research Department.

Because of the limited data, for convenience we have also shown the combined results for experience between 1983 and 1985 anniversaires (Table 13); only nine companies contributed experience between 1983 and 1984 anniversaries.

EXPERIENCE UNDER STANDARD ISSUES<br>DURING THE SIXTEENTH AND SUBSEQUENT POLICY YEARS

The 1984-85 experience during the sixteenth and subsequent policy years includes exposures of $\$ 123$ billion and actual deaths of $\$ 1.4$ billion. The 1983-84 experience included exposures of $\$ 117$ billion and actual deaths of $\$ 1.4$ billion.

Table 14 shows mortality ratios by attained age groups based on (1) the 1965-70 and 1975-80 Ultimate Basic Tables, (2) the Commissioners 1958 Standard Ordinary Mortality Table, and (3) the Commissioners 1980 Standard Ordinary Mortality Table.

The aggregate mortality ratio for the period from 1984 to 1985 anniversaries on the $1975-80$ Ultimate Basic Tables was 91.1 percent. The tabulation of aggregate mortality ratios on page 29 compares this result with the results of previous studies.

## Comparison of Ultimate Medical and Nonmedical Experience

Companies were asked to subdivide their ultimate data into medical and nonmedical if possible. Nineteen companies, comprising 72.0 percent of the total ultimate exposure, were able to subdivide their data, in whole or in part, in this manner. The combined experience between 1980 and 1985 anniversaries is shown in Table 15.

The pattern of this experience is generally similar to that in past years, in that the nonmedical experience has higher ratios at the older attained ages. The relatively low exposure at the younger attained ages limits the usefulness of the data. As in the 1983-84 study, at attained ages $35-39$ where most medical examinations were obtained because of a medical history, the medical experience shows higher mortality ratios.

## Comparison of Premium-Paying and Fully Paid-up Ultimate Experience

A comparison of the mortality on premium-paying and fully paid-up, excluding reduced paid-up, policies for the period from 1980 to 1985 anniversaries is shown in Table 16 for standard medical and nonmedical issues combined. Twenty companies submitted their experience separately on pre-mium-paying policies, while eighteen companies did so on fully paid-up policies. This difference could distort somewhat comparisons between pre-mium-paying and paid-up.

| All ages. | \$457,876,654 | \$47,276,823 | \$5,056,847 | \$1,118,717 | $71.9 \%$ | $75.7 \%$ | $95.0 \%$ | 93.3\% | 94.7\% | $98.6 \%$ |

*Premium-paying based on data from twenty companies; fully paid-up based on data from eighteen companics.

For all attained ages combined, the ratio of premium paying to paid-up mortality was 98.6 percent on the 1975-80 Select Tables. The ratios at attained ages $15-19$ and $30-59$ for premium-paying policies were significantly less than the ratios for fully paid-up policies.

## Comparison of Male and Female Experience

Table 17 shows the experience by sex and attained-age groups between 1980 and 1985 anniversaries for policy years 16 and over for standard medical and nonmedical issues combined. Twenty-one of the contributing companies submitted data, in whole or in part, separately for males and females for policy years 16 and over. As with Tables 7 and 8 , in comparing male and female mortality, the ratios of female to male mortality are based on the expected deaths for females calculated on the male table. For all ages combined, the 1980-85 ratio of female mortality to male mortality was 62.3 percent based on the 1975-80 Tables, essentially the same as for the 197984 experience.

## APPENDIX

Table A shows the proportion of total exposures between 1984 and 1985 anniversaries contributed by each company.
