V	Continuance Rates, All Elimination Periods, Male Occupation Group II, Sickness Disability
VI	Continuance Rates, All Elimination Periods, Female Occupation Group I, Sickness Disability

ABSTRACT

The first part of this study covers experience for the first year of the benefit period of individual disability loss-of-time policies. Results of data for the 1982 and 1983 exposure period submitted by thirteen companies are presented for males and females in Occupation Groups I and II. Annual claim rates, claim durations and claim costs (see Section IA for definitions) are emphasized for accident disability, sickness disability, and the total of accident and sickness disability. Also included are claim termination rates and claim continuance rates. Data are presented on experience by policy durations and by duration of disability, measured by policy-years exposed (in addition to the normal measurement by monthly income), together with various trends of experience.

The second part of this study covers experience of the second and third year of the benefit period of individual disability loss-of-time policies. For the 1981 and 1982 exposure period, results of the second year of the benefit period are given for Male Occupation Groups I and II and Female Occupation Group I, with most of the data submitted being for the 0-day elimination period for accident and the 7-day elimination period for sickness. For the 1980-81 exposure period, results of the third year of the benefit period are given for all elimination periods combined for Male Occupation Groups I and II.

I. EXPERIENCE IN FIRST YEAR OF BENEFIT PERIOD

This section of the report presents an analysis of morbidity experience under individual disability loss-of-time policies during the calendar years 1982 and 1983, with various results presented along with those of prior years. This section is limited to experience in the first year of the benefit period. Policies with benefit periods of less than one year are excluded from the study. The reporting system used for this study is generally the same as that used for the previous studies. This system is described in detail in the *TSA, 1959 Reports* (pages 126-128). Previous studies appear in the *TSA, Reports* of odd-numbered years, commencing in 1959, along with the *TSA, 1982 Reports*.

The tables contain experience for males in Occupation Groups I and II and also for females in Occupation Groups I and II; for convenience, these four groups are referred to in the rest of this report as "Male I," "Male II," "Female I," and "Female II." The amount of data on females in Occupation Group II is relatively small; therefore, these results should be viewed with caution.

Occupation Group I consists of occupations that involve little exposure of people to accident hazards and that do not require them to engage in heavy physical activity. In addition to those occupations involving white-collar and professional workers, Group I also includes occupations of persons engaged in trades and service work whose duties are light and nonhazardous, such as persons superintending manufacturing and construction operations.

Occupation Group II consists of occupations that involve a greater degree of exposure of people to accident hazards or in which the physical requirements of the job may be reflected in longer periods of disability due either to sickness or to injury than in the Group I occupations. These occupations generally include construction, heavy-vehicle operation, mechanics, skilled and semiskilled jobs in manufacturing industries, and the like. Occupations requiring perfect, or nearly perfect, physical condition also would be in Group II, since persons in such occupations may be disabled by an otherwise minor injury.

The presentation of data in the following tables generally follows the format used in prior reports. Most tables include (1) annual claim rates, (2) average claim durations in months, and (3) annual claim costs. Experience is shown separately for accident and sickness. Total disability experience is represented as the sum of the separate accident and sickness experience. The combined annual claim rates, average claim durations and annual claim costs for total disability sometimes reflect experience on different combinations of accident and sickness elimination periods, particularly those of shorter elimination periods.

Experience by policy duration groups is included. Policy duration is defined as being the exposure year minus the issue year. Exposure for the period in which the calendar year of exposure equals the issue year has been excluded from both the policy-year section of this study and the total study.

Annual claim rates (or frequencies or rates of disability incidence) have generally been calculated by dividing the amounts of monthly indemnity on claims by the corresponding exposures. These exposures are based on the amounts of monthly indemnity. Annual claim costs per \$1 of monthly income benefit have generally been calculated by dividing the aggregate benefits incurred on claims by the corresponding exposures. The data in all tables except for those in Tables 42-45 are expressed in terms of monthly income benefit. The data in Tables 42-45 are based on exposure expressed in terms of policy-years and on claims expressed in terms of claim counts; otherwise, the method of calculation is the same. Durations of claims in months, measured from the end of the elimination period, have been calculated by dividing the annual claim costs by the annual claim rates.

Payments for residual and partial disability benefits are not included in this study. Only total (or full) disability benefits are considered.

A. *Volume of Data*

For the calendar year exposure period of 1982 and 1983, the study is based on about 56,000 claims. The companies that contributed to the study are identified in Table 1 together with the volume of each company's data, separated by year of exposure and measured by the number of claims reported for those years.

TABLE 1

DISABILITY LOSS-OF-TIME, 1982-1983 EXPERIENCE
CONTRIBUTING COMPANIES AND NUMBER OF CLAIMS
FIRST YEAR OF BENEFIT PERIOD — ALL POLICY DURATIONS

Company	1982 Claims	1983 Claims
Prudential	9,405	8,457
Monarch	5,909	5,445
Metropolitan	3,429	2,801
Provident Life and Accident	2,432	2,325
John Hancock	1,711	1,504
Business Mens Assurance	1,372	1,337
Pacific Mutual	0	2,391
Mutual of New York	2,037	0
Guardian	896	759
Woodmen Accident and Life	797	793
Massachusetts Mutual	597	585
Continental Assurance	673	0
Provident Mutual	282	277
Total	29,540	26,674

Table 2 shows the distribution of the number of claims reported by type of coverage, sex, occupation group, and elimination period. The number of claims can be used as a good indicator of the reliability of the statistical results.

TABLE 2
 DISABILITY LOSS-OF-TIME, 1982-83 EXPERIENCE
 NUMBER OF CLAIMS BY TYPE OF COVERAGE, SEX,
 OCCUPATION GROUP AND ELIMINATION PERIOD
 FIRST YEAR OF BENEFIT PERIOD—ALL POLICY DURATIONS

ELIMINATION PERIOD (DAYS)	ACCIDENT				SICKNESS

All elimination periods	5,797	12,057	923	216	16,130	17,251	3,188	652

*Not studied in this report.

An additional measure of the volume of the data, the number of policy years exposed for each category, is included in Table 3. The primary difference between the total volume of exposures for accident coverages and that for sickness coverages is the inclusion of policies that cover only the disability hazard of accident, which constitute less than 1 percent of the total monthly income exposure for accident coverages. The trend toward the sale of policies having accident and sickness elimination periods equal to each other has continued.

*Not studied in this report.

About 95 percent of the monthly income exposures included in this study are from noncancelable policies, 4 percent from guaranteed renewable policies, and 1 percent from policies that are cancelable or renewable on a state basis. No analysis has been performed to determine whether any significant difference exists between policies with these different renewal provisions.

The average policy size in terms of dollars of monthly income exposed for each category is included in Table 4. There has been a trend toward the sale of policies with longer elimination periods, which has resulted in larger average policy sizes associated with the longer elimination periods. Tables 5 and 6 reflect the difference in average policy size between more recent issues in their first five policy years and earlier issues. As would be expected, the average policy size is larger for Occupation Group I than for Occupation Group II. However, in both Tables 4 and 5, the average policy size for Occupation Group II is larger than that for Occupation Group I for certain categories for 60- and 90-day elimination periods. This appears to arise as a result of different companies that have a different mix of business between these two occupation groups. Also, the average policy size is larger for males than for females.

The volume of data, measured by number of claims, is of sufficient size to report on for the 0-, 7-, 14-, 30-, 60-, and 90-day accident coverages and the 0-, 7-, 14-, 30-, 60- and 90-day sickness coverages. However, the volumes of data for the 60- and 90-day elimination periods are relatively small; therefore, data reported for these elimination periods should be viewed with caution. No experience was submitted for 0-day sickness coverage in the first five policy durations; as a result, for this policy-year grouping, 0-day accident and sickness experience has not been combined. In general, the combination of 0-day accident and sickness experience should be viewed with caution because 0-day sickness coverage has not been sold for many years. Experience for Female Occupation Group II is limited; as a result, experience for Female II is provided only in certain of the data presentations.

In interpreting results obtained from any experience study with a small volume of data, caution should be exercised. In comparing current results with those of previous studies, it must be kept in mind that the proportion of the total experience from each company is different in the current and previous studies. In addition, the same companies have not contributed to all the studies. Even if they did, the results of any intercompany study may not be appropriate to be applied to a specific company, because of the differences in circumstances of that company compared to the aggregate of several other companies.

In order to test the degree of variation in results by company, an analysis of variance study has been performed; even after taking into account the

several variables used in this study, there remain statistically significant differences in experience between companies. Tables 18, 19 and 20 provide some insight into these differences by indicating variations by contributing company for overall claim rates, claim durations, and claim costs for disability by sex and occupation group.

B. 1982-1983 *Disability Loss-of-Time Experience*

Tables 7, 8 and 9 provide summaries of the accident, sickness and total (sum of accident and sickness) disability experience, respectively, compiled in this section, for all policy durations combined. Each table shows the three elements of disability (annual claim rate, duration of the claim in months, and annual claim cost) by the four variables studied (sex, occupation group, elimination period, and attained age). In order to provide an indication of the credibility of the experience, the number of claims is shown. Ratios of experience of Male II to Male I and Female I to Male I are also given. Ratios for the total of all ages represent the weighted results of the decennial age ratios; monthly indemnities exposed are used as weights for claim rates and claim costs, while monthly indemnities on claims are used as weights for claim durations. As a result of this different weighting, the ratios for all ages for claim rates times those for claim durations do not always equal the ratios for claim costs, as might be expected if the same weight was used for all three.

Disability claim rates for accident as shown in these tables generally decrease by attained age for males, although this trend does not appear to hold for the experience for Male I policies with a 30-day elimination period. They are either level or increasing by attained age for Female I policies. Although claim durations for both sexes tend to increase by age, the patterns for some sex/occupation group/elimination period combinations do not appear entirely clear. Disability claim costs for accident tend to decrease by attained age for males and to increase by attained age for females, but not for all categories. Claim costs for accident are generally larger for Male Occupation Group II than for Male Occupation Group I. The relationship between the experience of Female I and Male I depends upon attained age and elimination period; disability claim costs for accident other than for the 30-day elimination period are often greater for females at older ages and less at younger ages.

Disability claim rates, claim durations, and claim costs for sickness generally increase in size by attained age. Disability claim costs for sickness are greater for Male Occupation Group II than for Male Occupation Group I. Disability claim costs for sickness tend to be greater at younger attained ages for Female I than for Male I, with the reverse generally being true at older attained ages. This claim cost relationship appears to be caused by differences in relative claim rate experience, rather than in relative claim duration experience. The ratio of overall sickness disability claim costs for Female I relative to Male I appears to increase with the length of the elimination period.

Since disability claim rates and claim costs for sickness are generally much greater than the corresponding claim rates and claim costs for accident disability, especially for females, total disability annual claim rates and claim costs for Occupation Group I and older ages tend to follow the pattern of those for sickness disability.

To provide some insight about age relativities in quinquennial groupings, Tables 10, 11, and 12 are provided. These correspond to the decennial attained age groupings given in the basic Tables 7, 8, and 9.

INDIVIDUAL DISABILITY LOSS-OF-TIME POLICIES 95

Tables 13, 14, and 15 provide summaries of accident, sickness, and total disability experience, respectively, for Female II. These tables also compare Female II experience to that of Female I. Female II claim costs appear to be significantly greater than those for Female I, caused primarily by larger claim rates.

Tables 16 and 17 provide summaries of accident, sickness and total disability experience for policies with 60-day and 90-day elimination periods, respectively. Claim rates are often larger for policies with 60-day elimination periods, with the opposite relationship holding true for claim durations. However, in several categories the opposite relation holds, presumably because there was not a sufficient amount of data or because the percentage of business contributed to each category by contributing companies varied.

Tables 18, 19 and 20 show the percentage variation by contributing company in claim rates, claim durations, and claim costs, respectively, for total disability loss-of-time experience. The ratios in the tables were calculated by weighting the ratio of each company's experience to that of the total study for each decennial age group/elimination period/type of disability combination by the appropriate exposure for that cell (by indemnity on claim for the calculation of claim duration rather than indemnity of exposure, as was done for the analysis of claim rates and claim costs). Both the number of companies and the percentage of total number of claims by range of deviation from the study average are given. Since the ratios are calculated on the basis of exposure, the distribution of percentage of number of claims does not always correspond to the variation in experience. Results indicate a wide variation by company, with greater relative variation in experience in claim rate and claim cost than in claim duration.

C. *Disability Loss-of-Time Experience by Policy Duration*

Disability loss-of-time experience has been subdivided by duration since policy issue. Policy duration is meant to represent the number of calendar years since policy issue, with experience from the calendar year of issue excluded.

Results for the first five policy durations combined were separated from later policy durations. Tables 21, 22, and 23 provide summaries of the first five policy durations combined in the same manner as was done in Tables 7, 8, and 9. Tables 24, 25, and 26 provide similar summaries for the sixth and later policy durations combined. Sufficient data are not available for Female II or for policies with 60- or 90-day elimination periods. Therefore, data on these subdivisions are not included here.

110 COMMITTEE ON INDIVIDUAL HEALTH INSURANCE

In addition to the preceding comparison, an in-depth analysis was performed by policy duration for claim costs. These are presented in Tables 27, 28, and 29, for Male I, Male II, and Female I, respectively. Claim costs for each decennial attained age grouping for accident and sickness were compared for policy duration groupings 1, 2, 3, 4, 5, 1-5, 6-10, 11-15, 16-20 and 21 and later to claim costs for all policy durations combined. The claim costs used for total disability were those for the sum of the claim costs for accident and sickness elimination periods. These ratios were then weighted by the appropriate exposures in terms of monthly indemnity to derive overall total ratios by sex and occupation group, with subtotals available by elimination period and type of disability. In order to make these results more credible, experience was combined for 1978 through 1983. Results for 1982 and 1983 are provided for all elimination periods combined for comparative purposes.

Greater claim costs for accident disability occur in early policy durations for males. Greater early accident claim costs for Female I appear only in policy durations 1 and 2. There exist significantly lesser sickness claim costs for all categories for the first policy durations, as compared to the prior study where significantly lesser sickness claim costs existed in the first two policy years for Male I only. Experience for older policies (policy durations 16 and later) are generally better than for more recent issues. No discernable difference in these trends by age is apparent.

In drawing any conclusions from these results, it must be kept in mind that there may have existed different benefit provisions, policy definitions, contributing company mix, and underwriting standards among different eras of disability income policies. Due to the existence of limited claim data for policies with 60- and 90-day elimination periods, significant fluctuations for results for these policies exist in Tables 27, 28, and 29.

D. Disability Loss-of-Time Experience by Duration of Disability

Table 30 shows claim costs for Male I, Male II, Female I, and Female II by duration measured from the date of disablement for 0-day accident and 7-day sickness elimination coverages. Tables 31 and 32 show these same values for 14- and 30-day elimination periods, respectively. Tables 33 and 34 show these same values for Male I, Male II, and Female I for 60- and 90-day elimination periods, respectively. Corresponding tabular values from the 1964 Commissioners Disability Table (CDT) are also shown for claim durations beyond the seventh day of disablement. The tabular values that are shown for accident disability for the first seven days of disablement were developed to be consistent with values in the 1964 CDT for the eighth and subsequent days of disablement.

In the comparison of crude claim costs with corresponding values from the 1964 CDT, it should be noted that a special situation exists at ages 60 to 69. Tabular values according to the 1964 CDT have been taken at the central age of each group, so that the tabular value shown for age group 60-69 is that for age 65. However, because many disability policies terminate at age 65, the average age for this group is probably closer to age 63; consequently, the comparable CDT values should be somewhat less than the values shown in Tables 30, 31, 32, 33, and 34. For the "Total" column in Table 30, the CDT value at age 63 for 0-day accident is 0.081; for 7-day sickness, it is 0.418; and for accident and sickness combined, it is 0.499.

It is important to note that the 1964 CDT was intended to be a minimum reserve standard for policies providing loss-of-time benefits for disability due to accident or sickness. It was developed to provide net valuation premiums which do not vary by occupational class or sex, rather than to provide the type of net premiums that would be considered desirable for use in preparing gross premium rates.

Tables 35, 36, and 37 provide rates of claim termination due to recovery or death for Male I, Male II, and Female I, respectively, and for accident, sickness, and total disability separately, for 1980-83. The data contributed did not permit a differentiation between those claimants who terminated due to recovery or death and those who remained disabled at the end of the first year of benefit period. As a result, termination rates for the twelfth month of benefit period are not provided. Because of limited data at the later claim months and certain elimination periods (particularly 60- and 90-day), significant fluctuations may occur; these results should be viewed with caution. The period of time for which disability continues, which is the basis of the calculation of these claim termination rates, was based upon the amount of indemnity paid divided by the monthly indemnity exposed and not upon the actual period of disability. (This definition of disability duration also is used for the calculation of claim continuation rates given in Tables 38, 39, and 40.)

Tables 38, 39, and 40 provide claim continuation rates for Male I, Male II, and Female I, respectively, for accident, sickness, and total disability separately, for 1980-83. These continuance rates represent the probability that \$1 of monthly indemnity exposed has continued to be paid out as a disability claim as of the end of the given period of time measured from the time of disablement. The data contributed did not permit a reliable calculation of a claim continuance rate for the twelfth month after the end of the elimination period. Therefore, such continuance rates are not included in these tables. Also included in these tables is the amount of monthly indemnity exposed for the appropriate sex/occupation group/elimination period/type of disability grouping.

Continuance rates for Male I generally decrease as the elimination period lengthens. This appears to have been caused by differences in claim incidence rates rather than by differences in claim termination rates. For Male II, while this relationship generally holds for longer elimination periods, at shorter elimination periods and younger ages, the opposite generally appears to occur. Patterns of rates of continuance for Female I are not consistent, possibly because of the relatively smaller amounts of experience for this category.

Continuance rates for age group 40-49 for the 1980-83 experience period are illustrated on Charts I through VI for Male I Accident, Male II Accident, Female I Accident, Male I Sickness, Male II Sickness, and Female I Sickness categories, respectively, to provide examples of relations between them by elimination period. As of any duration from disability, continuance rates generally decrease as the length of elimination period decreases.

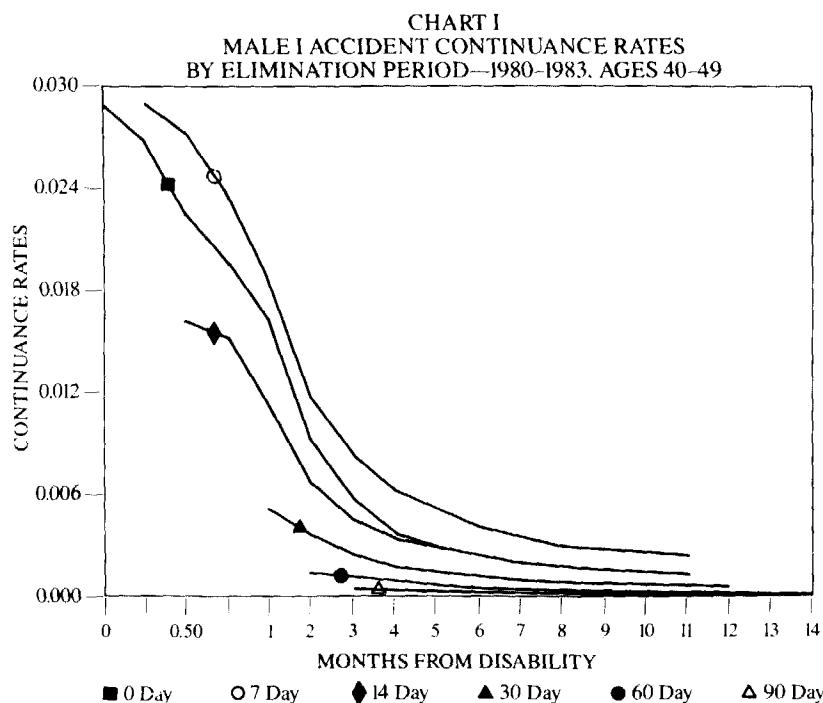

CHART II
MALE II ACCIDENT CONTINUANCE RATES
BY ELIMINATION PERIOD—1980-1983, AGES 40-49

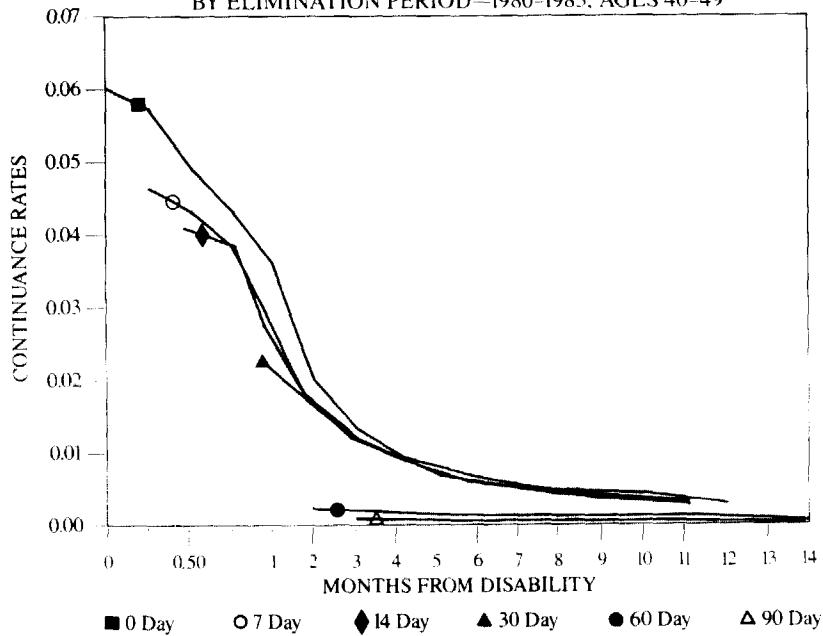

CHART III
FEMALE I ACCIDENT CONTINUANCE RATES
BY ELIMINATION PERIOD—1980-1983, AGES 40-49

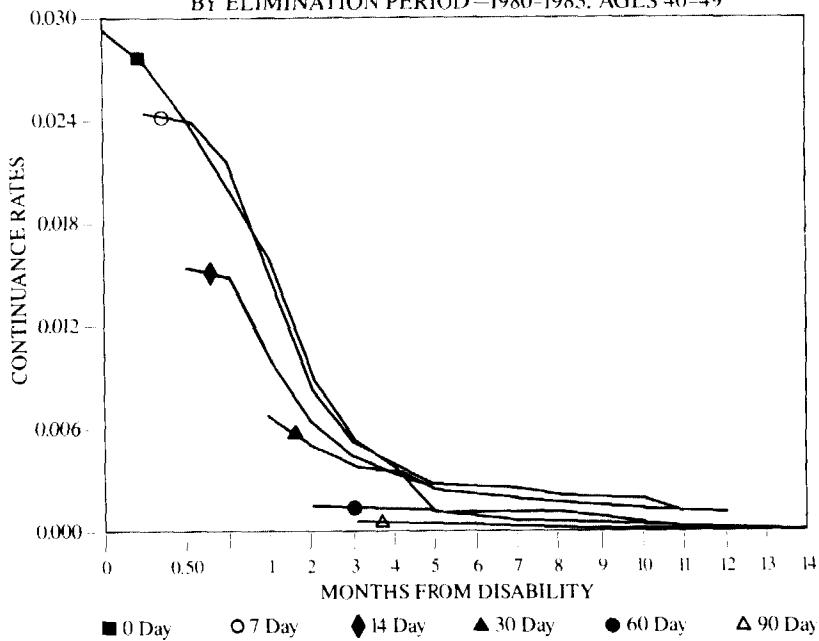

CHART IV
MALE I SICKNESS CONTINUANCE RATES
BY ELIMINATION PERIOD—1980-1983, AGES 40-49

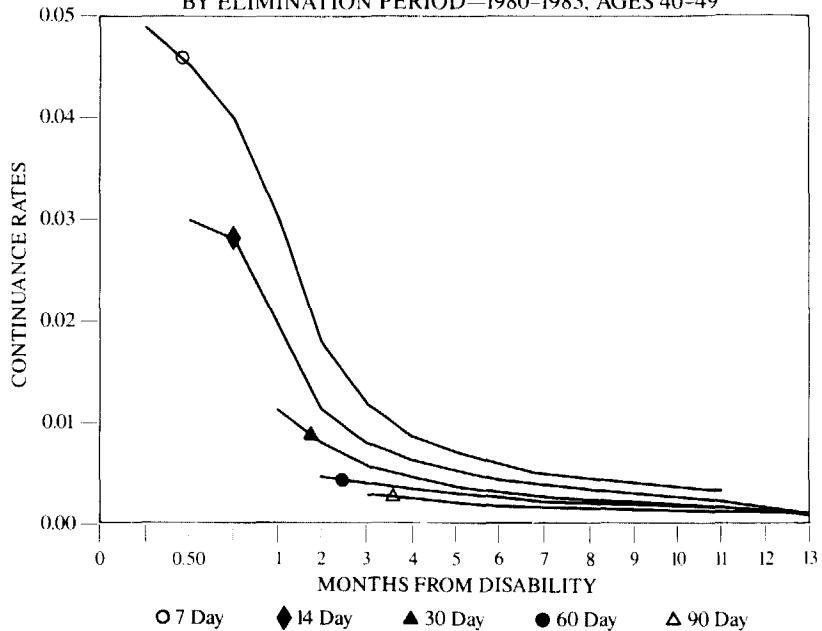

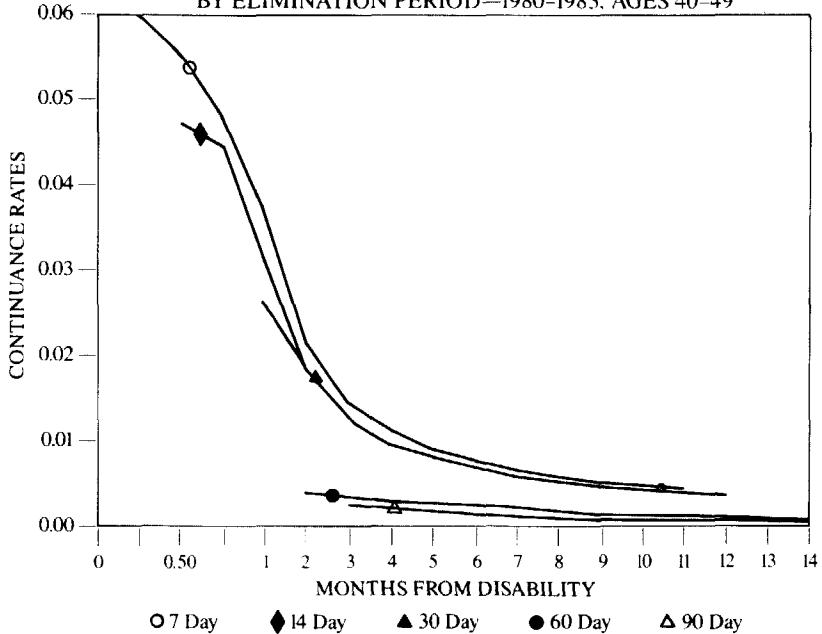

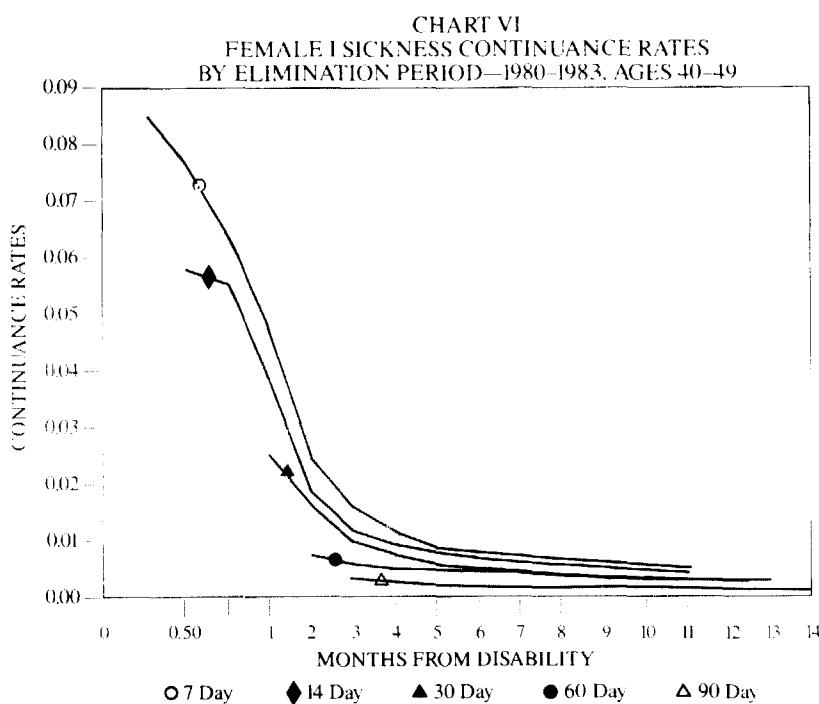

CHART V
MALE II SICKNESS CONTINUANCE RATES
BY ELIMINATION PERIOD—1980-1983, AGES 40-49

E. *Disability Loss-of-Time Experience with Exposures and Claims
Expressed in Terms of Policy-Years*

Tables 41, 42, and 43 correspond to the basic Tables 7, 8, and 9 with one difference. The calculations were performed on the basis of policy-years exposed, claim count, and claim duration in terms of number of claim months, rather than on exposures and claims in terms of amounts of monthly indemnities. This should provide a general indication of relative experience by policy size.

190 COMMITTEE ON INDIVIDUAL HEALTH INSURANCE

Table 44 provides ratios of claim costs from Tables 41, 42, and 43 to those given in Tables 7, 8, and 9, respectively. It appears that claim costs are generally larger when measured by monthly indemnity. Although not corrected by the impact of policy duration (with older policies generally having smaller average policy sizes), it appears that, in general, claim costs have been larger for larger size policies. The opposite relationship held true during 1982-1983 for Male I policies with a 30-day elimination period, Male II policies with a 60-day elimination period, and Male I and Male II policies with a 90-day elimination period.

F. *Disability Loss-of-Time Experience Trends*

Tables 45-59 show trends in experience for the first benefit year during years 1976-83. The claim rates, claim durations and claim costs given in the appropriate table are the aggregate values of the eight-year period. The values given for 1976-77, 1978-79, 1980-81, 1982, and 1983 are the ratios of the values for each period to the total of the combined experience.

Tables 45, 46, and 47 show these experience trends for accident coverage with a 0-day elimination period, for sickness coverage with a 7-day elimination period, and for the total of these two, for claim rate, claim duration, and claim cost, respectively. These same trends for experience are shown in Tables 48, 49, and 50 for 14-day elimination coverages, in Tables 51, 52, and 53 for 30-day elimination coverages, in Tables 54, 55, and 56 for 60-day elimination coverages, and in Tables 57, 58, and 59 for 90-day elimination coverages.

Over this eight-year period there has been a decrease in claim rates and claim costs in many, but not all categories. This decrease is particularly evident for the 0-, 7-, 14-, and 30-day elimination periods. Results in trends in experience for the 60- and 90-day elimination periods are not as clear. Although not consistent for all categories, it appears that experience for males tended to improve between 1982 and 1983, while experience for females tended to deteriorate between these two years.

The following table includes the weighted ratios of claim costs of 1976–1977, 1978–1979, 1980–1981, and 1982–1983 to claim costs of 1976–83, based upon monthly indemnity exposed.

WEIGHTED RATIOS OF CLAIM COSTS TO 1976–83 EXPERIENCE

	MI	MII	FI
1976–77	1.088	1.093	1.155
1978–79	0.955	1.044	1.049
1980–81	1.000	1.069	0.903
1982–83	0.988	0.843	0.972

Trends are given for the experience ratios of Male II to Male I in Tables 60, 61, and 62 for the periods 1976–77, 1978–79, 1980–81, and 1982–83 for claim rate, claim duration, and claim cost, respectively. These trends are provided for 0-, 7-, 14-, and 30-day elimination periods. Over this eight-year period, no consistent trend in these ratios is apparent. The ratios between Male II and Male I claim rates and claim costs are greater for accident disability than for sickness disability throughout.

Tables 63, 64, and 65 include similar trends in experience ratios of Female I to Male I. The ratios between Female I and Male I claim rates and claim costs tend to increase as the elimination period increases. Over this eight-year period, no consistent overall trend is apparent, although different trends appear to have occurred by different elimination periods, type of disability, and age. On an overall basis, claim rates and claim costs are larger for Female I compared to those for Male I; however, this relationship is sometimes reversed at attained-age group 60–69 and less frequently at attained-age group 50–59. These ratios for claim rates and claim costs are generally larger for accident disability than for sickness disability, with the opposite relationship generally holding for ratios for claim duration.

II. EXPERIENCE IN SECOND AND THIRD YEARS OF BENEFIT PERIOD

Eight companies contributed to this part of the study. The study is based on experience of the second year of the benefit period with respect to claims incurred during 1981 and 1982 and of the third year of the benefit period with respect to claims incurred during 1980 and 1981. Previous studies of experience during the second year of the benefit period appear in *TSA, Reports* of odd numbered years commencing in 1967 and in the *TSA, 1982 Reports*. Experience on policies having maximum benefit periods of less than two years (three years) is omitted in the second year (third year) study. Caution should be used in interpreting the results of certain sex/age group/occupation group/elimination period cells, because of a scarcity of claims, and in interpreting trends, because of a change in the companies who contributed to the study.

Annual claim rates have been calculated by dividing the amounts of monthly indemnity on claims that continued for at least 12 months for the second-year study and at least 24 months for the third-year study, measured from the end of the elimination period, by the corresponding exposures. Annual claim costs, expressed in terms of \$1 of monthly income benefit, have been calculated by dividing the aggregate benefits incurred on claims during the second or third year of the benefit period, depending on the study, by the corresponding exposure. Durations of claims in months in the appropriate benefit year have been calculated by dividing the annual claim costs by the annual claim rates.

Experience included in this study is being reported in two sections. The first is similar to that of most of the previous studies, including the experience of policies with 0-day accident and 7-day sickness elimination periods during the second benefit year. Seven companies contributed to this section of the study.

The second section of this study reports, for the second time, the second-benefit-year experience of policies with other than 0-day accident or 7-day sickness elimination periods, and third-benefit-year experience for policies with all elimination periods combined. Five companies contributed to this section of the study. Because of the differences in companies contributing to these two sections, caution must be used in comparing their results.

Tables 66, 67, and 68 report experience on second-year Male I, Male II, and Female I categories, respectively, for 0-day accident, 7-day sickness and combined 0-day accident and 7-day sickness coverages. These results include experience for claims incurred in 1973-78, 1979-80, and 1981-82. For the 1981-82 incurred claim year, 198 claims were reported in Male I, 214 in Male II, 31 in Female I and 4 in Female II.

Included in Tables 66, 67, and 68 are corresponding claim costs from the 1964 CDT. The 1964 CDT provides a useful basis of comparison with second-year claim costs, even though, as previously stated, it was developed to provide valuation net premiums and not to provide net premiums that might be considered appropriate in developing gross premiums. In comparing claim costs, it should be kept in mind that the 1964 CDT claim costs were derived from data that were not broken down by either sex or occupation group.

For 0-day accident and 7-day sickness elimination periods combined, claim costs are significantly greater for Male II than for Male I. Claim costs are greater for Female I than for Male I for age groups 30-59 for 1973-78 and for age groups 40-59 for 1979-80, while the opposite relationship holds for younger and older age groups. Claim costs are greater for Female I than for Male I for all age groups for 1981-82.

Tables 69, 70 and 71 report experience on second-year Male I category for the 30-day elimination period, Male II for the 30-day elimination period, and Male I for the 90-day elimination period, respectively. The data in these tables and in Tables 66 and 67 indicate that the initial elimination period still has a significant influence on claim costs in the second benefit year. Claim costs that are less for longer elimination periods are partially, but not totally, explained by the fact that this experience is slightly further away from the date of disability. It also can be seen that Male I claim costs are less than those for Male II for this experience.

Tables 72 and 73 report experience for Male I and Male II, respectively, for all elimination periods combined during the third benefit year for claims incurred during 1980-81. It is evident that there are still differences in experience by elimination period in the third benefit year. Claim costs for the third benefit year are less than for those of the second benefit year, and claim costs for Male II are greater than those for Male I. There was an insufficient number of claims for females to report on their experience.
