

**TRANSACTIONS OF SOCIETY OF ACTUARIES**  
**1957 VOL. 9 NO. 25**

**RESERVES FOR INDIVIDUAL HOSPITAL AND  
SURGICAL EXPENSE INSURANCE**

EDWIN L. BARTLESON AND JAMES J. OLSEN

**INTRODUCTION**

THE Joint Committee on Health Insurance appointed a subcommittee, known as Task Force 4, to study the problems of reserves for accident and health insurance. The Task Force, made up of insurance company and trade association representatives, under the chairmanship of John H. Miller, worked with a subcommittee of the Accident and Health Committee of the National Association of Insurance Commissioners. The final report of the Task Force, including basic tables of net annual claim costs for hospital and surgical expense insurance, was adopted by the NAIC at the December 1956 meeting. This final report, excluding the tables, is reproduced at the end of this paper as Appendix A.

We have prepared 30 tables, appearing at the end of this paper, for use in valuing hospital and surgical expense insurance in accordance with the recommendations of Task Force 4.

Tables 1 to 15, inclusive, show for the various benefits the following:

1. The annual rate of claim.<sup>1</sup>
2. The average claim per unit of benefit.<sup>1</sup>
3. The net annual claim cost ( $S_x$ ).
4. Commutation functions  $H_x$  and  $K_x$ .

These were computed by combining the net annual claim cost with the CSO Table and 2½% interest, as follows:

$$H_x = \frac{1}{2} (D_x + D_{x+1}) \cdot S_x \quad K_x = \sum_{z=0}^{99} H_z$$

5. Single and annual premiums for Term to Age 65.

These were computed by the usual formulas:

$$\text{Net single premium} = \frac{K_x - K_{65}}{D_x}$$

$$\text{Net annual premium} = \frac{K_x - K_{65}}{N_x - N_{65}}$$

<sup>1</sup> These are not shown for the maternity benefit (Table 15). For this benefit, it was assumed that the maximum amount would be payable in each case so that the claim rate and the net annual claim cost for \$1 of benefit are equal.

The net annual claim cost is the product of the annual rate of claim and the average claim value. In the case of the Daily Hospital Benefit, however, the average claim values shown were derived later by dividing the net annual claim costs by the annual rates so that the net annual claim costs obtained by multiplication will differ occasionally in the last figure from those shown.

The net annual claim costs shown in Tables 1 to 15, inclusive, are the same as those included with the Task Force 4 report, except that we have changed the unit of benefits for convenience. Task Force 4 prepared net annual claim costs with a minimum age of 20 and a maximum age of 80 for Hospital Expense and 65 for Surgical Expense. In order to cover all "adult" ages and all expiry ages, we have extended the basic tables. These tables are not to be used for dependent children under family policies; but for the relatively few adult contracts issued at ages 15 through 19 we have extended the basic tables by using the same net annual claim cost as for age 20. Also, we have assumed that the Hospital Expense cost at age 80 applies at ages over 80 and that the Surgical Expense cost at age 65 applies at ages over 65. There is very little information available at the higher ages, but it appears to the authors that these convenient assumptions are accurate enough for reserve purposes.

Tables 16 to 30 at the end of this paper show mid-terminal reserves for the first 15 policy years for Term to 65 insurance for the various benefits.

#### MODIFICATION OF BASIC TABLES

Individual hospital expense policies vary widely in the extent of coverage. Therefore, it will usually be necessary to modify the basic tables in order to compute policy reserves. Approximate methods which permit simple application without extensive calculations and construction of additional tables seem highly desirable, particularly in this early developmental stage of the business.

In this paper, it will be shown how we have modified the basic tables for the valuation of one of Prudential's Family Hospital Expense policies. The results may not be directly usable by any other company, but it is hoped that the presentation may help others faced with similar problems.

The policy we have chosen for illustration is our form SA OHS-154, issued from May 1954 to March 1957, at adult ages 18 to 59, inclusive, on the Term to Age 65 basis. This policy provides the following benefits:

1. *Daily Hospital Benefit*.—Maximum duration of 150 days for any one sickness or accident. Issued with a choice of daily indemnity benefit from \$5 to \$15 by one dollar intervals.
2. *Miscellaneous Hospital Expense Benefit*.—An unallocated reimbursement

benefit for hospital charges other than room and board, expressed as a multiple of the daily benefit, with the maximum varying by duration of hospital confinement, as follows:

Number of Days of Hospital Confinement	Maximum Miscellaneous Hospital Expense Benefit Expressed as a Multiple of the Daily Hospital Benefit
1.	6
2.	7
3.	8
4.	9
5.	10
6-10.	11
11-15.	12
16-20.	13
21-25.	14
26-30.	15
31-35.	16
36-40.	17
41-45.	18
46-50.	19
51 or more.	20

3. *Maternity Benefit*.—Reimbursement of hospital expenses up to ten times the daily benefit.
4. *Surgical Benefit*.—Reimbursement according to schedule with \$200 or \$300 maximum, as selected.
5. *Physicians' In-Hospital Calls Benefit for Nonsurgical Hospital Confinements*.—Reimbursement benefit of \$3 per day with aggregate per confinement of \$100 with the \$200 surgical schedule, and \$200 with the \$300 surgical schedule.
6. *Poliomyelitis Expense Benefit*.—Reimbursement benefit with maximum of \$4,000 with the \$200 surgical schedule, and \$7,000 with the \$300 surgical schedule.

We shall now determine modifications of the 1956 Intercompany Tables to obtain reserve factors for these benefits.

1. *Reserves for the Daily Hospital Benefit*: The maximum duration of benefits for the Intercompany Table is 90 days but our policy is for 150 days. We analyzed, by age and sex, all claims incurred in 1955 under our policies with the 150 day maximum. Table A shows what proportion of the total number of days paid would have been payable if the maximum had been 31, 60, 90, 120 or 150 days. From this study we concluded that the modification of the basic tables need not be made for individual ages but can be made for all ages combined. This arrangement is a great convenience as it enables us to use the 90 day reserve factors with a simple over-all percentage adjustment.

The results shown in Table A were compared with those shown in Mr. Gingery's review (*TSA IV*, 686) of the discussion of his paper "Special

Investigation of Group Hospital Expense Insurance Experience." His table, which is for all ages combined, shows the ratio of the daily hospital benefit cost for a  $t$  day maximum to a 31 day maximum. His table has been converted to show the ratio of the cost for a  $t$  day maximum to a 90 day maximum and is shown as Table B. Since the study we made (Table A) was so close to Mr. Gingery's published results, as represented in Table B, we decided to use his data. Mr. Gingery furnished us the factors for all values of  $t$ . Table C, based on these factors, shows factors which can be used to modify the net annual claim costs (or reserve factors) for a 90 day maximum to other maximum durations. While Mr. Gingery's table has separate values for female employees and dependent spouses, we have derived the factors for all women from Mr. Gingery's data for dependent spouses. The difference would be small in any case, most women insured under individual policies are covered as dependents, and Task Force 4 made no distinction in this respect.

*2. Reserves for Miscellaneous Hospital Expense Benefits:* The 1956 Inter-company Tables showed net annual claim costs for several unallocated maximums. These were considered to be independent of the maximum duration of daily benefits because most of such expenses are incurred in the first part of the confinement and because many policies allow such benefits up to the maximum even if the expenses are incurred after the maximum daily benefits have been paid.

There are many different policy provisions for these benefits and those with "inside limits" or other special features will have to be considered individually. One of the more common clauses has an unallocated maximum stated as a multiple of the Daily Hospital Benefit. For such policies it is possible to have a valuation class for each size policy. In such a case, factors for maximums not shown in the basic tables must be derived. These may be obtained practically by linear interpolation or more precisely by applying the formulas used to compute the average claims in the basic tables.

These formulas are as follows:

- (1) The average claim value at age 20 for a maximum benefit of  $m$  ( $= 50, 100, 150$  or  $250$ ) is  $.0000064 m^3 - .00374 m^2 + .901 m + 3.5$ .
- (2) The increment to the average claim value for each year of age 21 to 80, inclusive, for a maximum benefit of  $m$  ( $= 50, 100, 150$  or  $250$ ) is

$$\underline{.00000092 m^3 - .000636 m^2 + .1849 m - 5.37}.$$

12

(Where this produces a value greater than the maximum, the maximum is used.)

323-384		1.09

In Table D we show that when the miscellaneous benefit maximum is 10 times the daily benefit, the reserve for the miscellaneous benefit per \$1 of daily benefit changes very little for small changes in the maximum. From this it appears to us that sufficiently accurate results may be obtained by computing the average maximum miscellaneous benefit, interpolating linearly between the reserve factors in the basic tables to obtain the reserve factor applicable to this maximum, and then dividing by the average-sized policy to obtain reserve factors per \$1 of daily hospital benefit. Thus, if the average daily benefit is \$9.50 and the maximum miscellaneous benefit is 10 times the daily benefit, the average maximum would be \$95. Interpolating in Tables 20 and 22, we obtain a fifth policy

TABLE D  
MALE—ISSUE AGE 35—TERM TO AGE 65 HOSPITAL  
EXPENSE INSURANCE

AMOUNT OF DAILY BENEFIT	MAXIMUM MISCELLANEOUS BENEFIT	MID-TERMINAL RESERVE FOR MISCEL- LANEOUS HOSPITAL EXPENSE BENEFIT FOR \$1 OF DAILY BENEFIT		
		5th Policy Year	10th Policy Year	15th Policy Year
\$ 5	\$ 50	\$1.25	\$2.38	\$3.11
10	100	1.23	2.35	3.08
15	150	1.08	2.06	2.70
25	250	.85	1.62	2.12

year reserve factor for male age 35 of \$11.71 for a maximum of \$95. Dividing by 9.5 we get a reserve factor of \$1.23 per \$1 daily benefit. From Table D, it will be noted that the factor would still have been \$1.23 if the average shifted from \$9.50 to \$10.

In the case of our policy, there is the additional complication of the maximum also varying with the period of confinement. Accordingly, we determined the average "times" benefit by using Mr. Gingery's continuation Tables VII-2 and VII-4a (TSA IV, 99 and 102), multiplying the factor for each duration by the number of persons confined for that exact duration and dividing the sum by the total number of persons confined. This gives us an average maximum of 10.3 times the daily benefit for men, and 10.2 times for women. From the in-force at the end of 1956, we determined the average daily benefit to be \$9.35. Accordingly, the average maximum is \$96.31 for men and \$95.37 for women. Interpolating in Tables 20 and 22, and dividing by the above average daily benefit, we get reserve

factors for the Miscellaneous Hospital Expense Benefit per \$1 of Daily Hospital Benefit.

3. *Reserves for Maternity Benefits:* In the case of our policy, no modification of the 1956 Intercompany Table is necessary. For each dollar of Daily Hospital Benefit in force for women the maternity reserve is 10 times the reserve factor shown in Table 30.

4. *Reserves for Surgical Benefits:* With the 1956 Intercompany Tables published in the 1957 Proceedings of the NAIC, there was included a rule for evaluating a surgical schedule in terms of the "standard" (*1952 Reports of Mortality and Morbidity Experience*, 47-50) on which the tables of net annual claim costs were based. The ten operations, for men and for women, that account for the bulk of all payments according to the Group Surgical Claims Study (*TASA XLIX*, 142 ff.) were so weighted that the sum of the products of these weights by the payment for \$100 maximum evaluates the schedule as a percentage of "standard." Thus, if a schedule evaluates to 93% of standard, the sum of the maximums in each valuation cell divided by 100 and multiplied by 93% of the tabular standard reserve factor per \$100 will give the reserve.

The calculations for our surgical schedule are given in Table E and show that we may use the basic surgical tables without modification.

5. *Reserves for Physicians' In-Hospital Calls Benefit:* Task Force 4 recommended that 40% of the net annual claim cost per \$1 of Daily Hospital Benefit be used to obtain the net annual claim cost for each dollar of daily maximum Physicians' In-Hospital Calls Benefit.

The average maximum surgical benefit for this policy is \$237, with 63% having a maximum of \$200 and 37% a maximum of \$300. Therefore, a maximum benefit of \$100, or 33 days at \$3 per day, is provided under 63% of our policies and a maximum benefit of \$200, or 67 days at \$3 per day, is provided on the remaining 37%. Using Table C, we find the value of a Daily Hospital Benefit for 33 days is 88% of that for 90 days for men and 92% for women, and for 67 days 97% for men and 98% for women. Then the average net annual claim cost (or reserve factor) of the amount of this benefit provided for each \$100 of Surgical maximum is, for men,

$$\frac{.4 \times 3 \times (.63 \times .88 + .37 \times .97)}{2.37} \text{ or } .46$$

and, for women,

$$\frac{.4 \times 3 \times (.63 \times .92 + .37 \times .98)}{2.37} \text{ or } .48$$

times the net annual claim cost (or reserve factor) per \$1 Daily Hospital Benefit, 90 day limit.

\* Average payment; schedule pays \$12.50 if hospitalized, otherwise \$5.00.

† Average payment; schedule pays \$25 if internal, \$12.50 if external.

6. *Reserves for Poliomyelitis Expense Benefit:* The cost of this benefit is very small for adults and decreases with age. Accordingly, if we were to compute reserves there would be a very small negative reserve to subtract from the reserves for other benefits. Task Force 4 did not propose any basis of reserves for this benefit and we do not suggest any reserve or adjustment of reserve therefor.

#### STANDARDS OF VALUATION

Appendix A shows the minimum valuation standards recommended by Task Force 4. In our own case, we intend using the same interest and mortality basis as used for the valuation of our Ordinary life insurance, CSO at  $2\frac{1}{2}\%$  interest, in combination with the 1956 Intercompany Hospital and Surgical Tables, with the necessary modifications as outlined in this paper. We intend using two-year preliminary term mid-terminal reserves in addition to gross pro-rata unearned premium reserves. Since most of our business is issued on the monthly premium basis, reserves calculated on this basis are only slightly higher than reserves calculated by the mean reserve method. Furthermore, by using the mid-terminal method the "Additional Reserve" is determined independently of the "Pro-Rata Unearned Premium Reserve" and it is therefore unnecessary to calculate net premiums for the benefits for which an "Additional Reserve" is not required.

*Reserves for Dependent Children:* Task Force 4 made no recommendations with respect to reserves for dependent children. Mid-terminal reserves for dependent children would be negligible if not actually negative, and we intend holding only the pro-rata unearned premium reserve.

*Negative Reserves:* Task Force 4 recommended that "negative reserves on any benefit may be offset against positive reserves for other benefits in the same individual or family policy, but that if all benefits of such policy collectively develop a negative reserve, credit shall not be taken for such amount."

Negative reserves occur at all ages and durations for the maternity benefit and at many ages and durations for the surgical benefit for women.

We intend to take credit for the negative reserves on the surgical benefit but we do not intend to take credit for the negative maternity reserves. By using this approach on the maternity benefit we are able to calculate the reserves by lives rather than by policies and to use the same factors for women insured under individual policies, where there is no maternity benefit, and family policies. We made model office tests by calculating reserves on the two-year preliminary term basis with no credit for the negative maternity reserves and reserves on the level premium basis with a

credit for the negative maternity reserves. We found that the aggregate reserves by the first method were always smaller until 15 years of issue are included, after which the two methods produced about the same aggregate reserves.

#### VALUATION PROCEDURES

We intend valuing by 5 year age at issue groups. There will be two types of reserve factors: the first is per \$1 of Daily Hospital Benefit, combining the reserves for the Daily Benefit and the Miscellaneous Hospital Benefit; the other is per \$100 of Maximum Surgical Benefit, combining the reserves for the Surgical Benefit and the Physicians' In-Hospital Calls Benefit.

For example, the reserve factors on the two-year preliminary term basis for the seventh policy year for men in the issue age group 25-29, of which the central age is 27, are based on the factors shown in the various tables for issue age 29 and policy year 5 and are determined as follows:

1. Daily Hospital Benefit.—The tabular reserve factor from Table 16 is \$2.04, and in order to modify the factor for a 150 day plan it is necessary to multiply by 1.04 (see Table C) which gives a factor of \$2.12.
2. Miscellaneous Hospital Expense Benefit.—As indicated previously, the average maximum benefit is \$96.31. Interpolating linearly in Tables 20 and 22 we get \$11.06. Dividing this by the average daily benefit of \$9.35, we get a reserve factor for the Miscellaneous Hospital Expense Benefit per \$1 of Daily Hospital Benefit of \$1.18.
3. Surgical Expense Benefit.—The reserve factor of \$1.96 is obtained directly from Table 28. Since our schedule evaluates to 100% of standard, no modification is necessary.
4. Physicians' In-Hospital Calls Benefit.—As indicated previously, the reserve factor for the benefit per \$100 of Surgical Maximum for men is .46 times the tabular reserve factor per \$1 of Daily Benefit. From Table 16 we find the reserve factor per \$1 of Daily Benefit to be \$2.04 and therefore our reserve for this benefit per \$100 of Surgical Maximum is .46 times \$2.04 or \$0.94.

The reserve factor per \$1 of Daily Hospital Benefit is, therefore, \$2.12 plus \$1.18 or \$3.30, and the reserve factor per \$100 of Surgical Maximum \$1.96 plus \$0.94 or \$2.90.

In order to simplify our valuation procedure we shall use the following approximate method.

As of June 30, 1957 for each year of issue and policy form we shall tabulate our in-force by five year age at issue groups, separately for men and women. A punch card is maintained for each life and not by policy. For each of the above cells the total amount of Daily Hospital Benefit and Maximum Surgical Benefit will be shown. Appropriate reserve factors,

one set applicable to a December 31, 1957 valuation and one set to a December 31, 1962 valuation, will be applied to the June 30, 1957 in-force. The total reserve for all benefits as obtained from each set of factors will be divided by the Daily Hospital Benefit in-force as of June 30, 1957 to obtain average reserve factors per \$1 of Daily Hospital Benefit as of December 31, 1957 and as of December 31, 1962. By interpolating linearly between the two factors we shall obtain average reserve factors for the ends of each of the years 1957 to 1961, inclusive, which will be applied to the in-forces at the ends of these years to obtain the reserve. A similar procedure will be followed in 1962 and quinquennially thereafter. Although in the above method an average reserve factor is obtained for each policy form for each year of issue, it could be modified to obtain an average reserve factor for each policy form, all years of issue combined, for those policy forms which are no longer being sold.

APPENDIX A  
REPORT OF TASK FORCE 4  
NOVEMBER 26, 1956

Task Force 4 was established by the Joint Committee on Health Insurance to study the problem of reserves for accident and health insurance. Since the termination of the Joint Committee on Health Insurance, Task Force 4 is continuing to carry out its assignment, in coordination with the Subcommittee on Valuation and Reserves of the Actuarial and Statistical Committee of the Health Insurance Association of America.

Coincident with the formation of Task Force 4, the National Association of Insurance Commissioners established a Subcommittee to Study Reserves for Guaranteed Renewable Accident and Health Policies.

The reserve requirements recommended in this report relate to individually underwritten accident and health policies where both of the following conditions prevail:

- I. Renewability of the policy is guaranteed or the company's right to refuse renewal is limited. (See policy types A, B, and C described on page 2.\*)
- II. The basic annual benefit costs increase generally with advancing age.

The basic principle underlying these recommendations is that reserves should be maintained on all accident and health policies sufficient to place a sound value on the policy liabilities. To the extent consistent with this principle, the reserve requirements should be broadly comprehensive, yet sufficiently flexible to be applicable to the many different valuation problems that may be encountered.

\* Page 347 herein.

### RECOMMENDATIONS

1. Reserve requirements should be established by regulation on a basis uniform for all states and other jurisdictions. It is therefore recommended that the National Association of Insurance Commissioners adopt a report incorporating advisory uniform regulations and a statement relative to legislation for any states in which the adoption and enforcement of the proposed regulations would require an enabling act. The regulations should include in substance the following provisions, which are incorporated in the "Proposed Regulations" set forth in this report.
  - (a) For benefits with respect to which suitable experience data are available, specific minimum reserve standards should be stipulated.
  - (b) For other benefits, the requirement should be made that each insurer determine and maintain reserves which place a sound value on the policy liabilities. As reliable experience statistics are accumulated for such benefits, the regulations should be amended to incorporate specific minimum standards in place of this general requirement.
2. To provide for the amendment from time to time of the minimum reserve standards and for the adoption, on a uniform basis, of such new experience tables as may be developed in the future, the NAIC Subcommittee to Study Reserves for Guaranteed Renewable Accident and Health Policies should be maintained as a standing committee. It is suggested that the words "Guaranteed Renewable" be omitted from the title of this committee so that it will clearly be within its province to consider other valuation problems in the field of accident and health insurance. This committee should be authorized and directed to receive and consider changes in the regulations which may be proposed by supervisory officials, industry groups or associations, or individual insurers and to make its recommendations to the NAIC Accident and Health Committee.

### LEGISLATION

#### (WHERE ENABLING LEGISLATION IS REQUIRED)

Existing legislation is sufficient in most jurisdictions to permit the adoption of the regulations proposed in this report. It is recommended that in states where legislation is considered to be necessary to carry out the other recommendations of this report, such legislation should take the form of an enabling act under which the recommended regulations may be adopted by the Commissioner or other supervisory authority. Such legislation should also include provisions consistent with the law of the enacting state for due notice and hearing before the regulations are adopted and for the right of judicial review.

## PROPOSED REGULATIONS

## For the Valuation of Individual Accident and Health Policies

(a) *Types of individual accident and health insurance policies*

- A. Policies which are guaranteed renewable for life or to a specified age, such as 60 or 65, at guaranteed premium rates.
- B. Policies which are guaranteed renewable for life or to a specified age, such as 60 or 65, but under which the insurer reserves the right to change the scale of premiums.
- C. Policies, other than those in Type D, in which the insurer has reserved the right to cancel or refuse renewal for one or more reasons, but has agreed implicitly or explicitly that, prior to a specified time or age, it will not cancel or decline renewal solely because of deterioration of health after issue.
- D. Franchise policies or certificates issued under or subject to an agreement that, except for stated reasons, the insurer will not cancel or refuse to renew the coverage of individual insureds prior to a specified age unless all coverage under the same group is terminated.
- E. Commercial policies and other policies not falling within Types A to D, inclusive.

(b) *Standards of valuation for policies of Type A, B, or C*

During the period within which the renewability of the policy is guaranteed or the insurer's right to refuse renewal is limited, the minimum reserve for policies of Type A, B, or C, issued on or after January 1, 1955, shall be an amount computed on the basis of two-year preliminary term tabular mean reserves employing the following assumptions:

Mortality: 1941 Commissioners Standard Ordinary Table or American Men Ultimate Table.

Interest: The maximum rate permitted by law in the valuation of currently issued life insurance.

Morbidity or other Contingency:

Disability due to accident and sickness—Conference Modification of Class III Disability Table.

Hospital Expense Benefits—1956 Inter-company Hospital Table.  
Surgical Expense Benefits—1956 Inter-company Surgical Table.

For accident only, major medical expense, and other benefits not specified above, each company is required to establish reserves that place a sound value on the liabilities under such benefit.

Such mean reserves shall be diminished or offset by appropriate credit for the valuation net deferred premiums. In no event, however, shall the aggregate reserves for all policies issued on or after January 1, 1955 and

valued on the mean reserve basis, diminished by any credit for deferred premiums, be less than the gross pro rata unearned premiums under such policies.

*Negative Reserves.* It is recommended that negative reserves on any benefit may be offset against positive reserves for other benefits in the same individual or family policy, but that if all benefits of such policy collectively develop a negative reserve, credit shall not be taken for such amount.

(c) *Standard of valuation for policies of Type D or E.*

For policies of Type D or E, the pro rata gross unearned premium reserve shall continue to be held.

(d) *Alternative valuation procedures and assumptions*

Provided the reserve on all policies to which the method or basis is applied is not less in the aggregate than the amount determined according to the applicable standards specified above, an insurer may use any reasonable assumptions as to the interest rate, mortality rates, or the rates of morbidity or other contingency, and may introduce an assumption as to the voluntary termination of policies. Also, subject to the preceding condition, the insurer may employ methods other than the methods stated above in determining a sound value of its liabilities under such policies, including but not limited to the following: (i) the use of mid-terminal reserves in addition to either gross or net pro rata unearned premium reserves; (ii) optional use of either the level premium, the one-year preliminary term, or the two-year preliminary term method; (iii) prospective valuation on the basis of actual gross premiums with reasonable allowance for future expenses; (iv) the use of approximations such as those involving age groupings, groupings of several years of issue, average amounts of indemnity; (v) the computation of the reserve for one policy benefit as a percentage of, or by other relation to, the aggregate policy reserves, exclusive of the benefit or benefits so valued; (vi) the use of a composite annual claim cost for all or any combination of the benefits included in the policies valued.

For statement purposes the net reserve liability for active lives may be shown as (i) the mean reserve with offsetting asset items for net unpaid and deferred premiums, (ii) the excess of the mean reserve over the amount of net unpaid and deferred premiums, or (iii) it may, regardless of the underlying method of calculation, be divided between the gross pro rata unearned premium reserve and a balancing item for the "additional" reserve."

## COMMENT AND EXPLANATION

*Reserve Fund*

The recommendations of this report are based on the concept of the reserve as a fund which, together with future net premiums, will meet the benefit payments arising from the group of policies valued as they accrue in the future. It should be observed that the application of a formula for the calculation of such reserves to an individual policy does not produce a meaningful result since few policyholders will experience average morbidity. For the policyholder in impaired health, the necessary reserve, if it could be determined, would be very much greater than the average result for policyholders as a whole, and for a policyholder in good health such reserve would be less than the average.

*Occupation*

Experience tables available for the determination of reserves are generally based upon the average results of the insured policyholders and therefore represent a cross section of the insured population, including individuals with unusual freedom from occupational and other accident hazards, as well as those subject to a considerable extra hazard owing to occupation or avocation. Accordingly, it is not considered necessary to make special provision in the valuation of the liabilities for policies involving special occupational hazards. It may also be observed that where tabular reserve methods are employed the incidence of any additional cost owing to occupational hazard may be such that there will be no increase in the reserve otherwise required.

*Two-Year Preliminary Term*

The preliminary term method of valuation recognizes the fact that expenses in the first year are much higher than those in renewal years and normally leave none of the first year premium available for the reserve fund. This method has been long accepted as appropriate and adequate for valuation purposes of life insurance. In contrast to life insurance, the claim cost at the early policy years under accident and health insurance may be substantial. Thus, for two policy years or even longer, the insurer may have a substantial unliquidated initial expense before setting up any additional reserve. For these reasons our recommendations provide for a preliminary term period of two years in the minimum reserve basis.

*Assumptions as to Rate of Termination of Policies*

The voluntary termination of policies may have a substantial effect on the level of premiums required for accident and health policies as well

as on the amount of the reserve which should be maintained. In view, however, of the wide variation in termination rates among different insurers and the fluctuation of termination rates with changing business conditions, it is not recommended, at this time, that a rate of voluntary termination be employed in the calculation of minimum reserves. It is recommended, however, that an insurer be permitted to employ a lapse rate in the computation of reserves, provided that the net result is at least equal to the minimum reserves specified by the proposed regulations.

#### *Loss of Time Benefits*

Special studies of the Task Force indicate that a number of companies are holding reserves on the basis of higher standards than the Conference Table. However, the Task Force has not, as yet, been able to obtain sufficient experience data upon which to develop a new disability table. It is expected that through the efforts of the Committee on Experience under Individual Accident and Sickness Insurance of the Society of Actuaries data on which a new table may be constructed will be available in the near future. As a temporary measure, therefore, Task Force 4 recommends the continued use of the Conference Table as a minimum basis. However, it strongly recommends that in any case where, in the judgment of the company, this basis does not place a sound value on the liabilities under its accident and health policies, an adequate reserve be established. Particular consideration should be given to the adequacy of reserves under policies which provide sickness benefits in excess of a two-year limit.

#### *Benefits for Confining Disability*

A special subcommittee has been appointed to study the available experience data with respect to loss of time benefits payable for house-confining disability. The Task Force concurs in this subcommittee's recommendation of (i) further study in respect to minimum valuation standards for policies providing house-confining sickness disability benefits and (ii) the continued use of the Conference Modification of Class III as the minimum standard of valuation for loss of time policies providing house-confining sickness benefits, in accordance with the National Association of Insurance Commissioners' Advisory Ruling of June 11, 1941, pending such further study.

#### *Accident-only Benefits*

No specific standards are being recommended at this time for accident-only benefits.

A committee of the Society of Actuaries is engaged in an inter-company

study of accidental death experience which, when completed, will be available for use in developing specific reserve standards. Meanwhile, any of the recognized tables of accidental death rates may be used as a basis for establishing reserves for the accidental death benefit.

With respect to disability benefits payable only as a result of accidental injuries, the Committee on Experience under Individual Accident and Sickness Insurance contemplates the collection of statistical data upon which experience tables may be developed. In the interim it is suggested that companies may establish reserves based upon an appropriate modification of the Conference Table or such other table as may be used for valuing benefits payable for accident or sickness disability, such modification reflecting the proportion of disability arising from accidental injuries at each of the ages involved.

#### *Medical Expense Benefits*

The volume of nonsurgical medical expense insurance issued on an individual basis is relatively small and experience data are quite scant. With respect to benefits payable on a per diem or per visit basis, it is suggested that reserves be established according to appropriate percentages of the incidence of disability if benefits are payable during total disability only, or of the incidence of hospitalization if benefits are limited to in-hospital care. For in-hospital medical expense benefits payable on cases not involving surgery, available evidence indicates that 40% of the corresponding per diem hospital confinement cost may represent a reasonable estimate of the benefit cost for valuation purposes.

As a basis for the valuation of major medical expense benefits pending the accumulation and analysis of inter-company experience data, reference may be made to the material presented by Mr. Morton D. Miller and Mr. Charles N. Walker in Volume VII of the *Transactions* of the Society of Actuaries.

#### *New or Experimental Benefits*

For some benefits there will be insufficient data for the development of experience tables suitable for general use in computing reserves. With respect to such benefits each insurer should, on the basis of its appraisal of the benefit costs, establish and maintain reserves which place a sound value on the liabilities thereunder.

#### *Franchise Policies*

Franchise accident and health insurance includes some of the characteristics of individual policy insurance and for this reason should receive special consideration with respect to policy valuation. We are making no

recommendations at this time with respect to additional reserves for franchise insurance, but believe that the subject should be given further intensive study by the appropriate committee of the Health Insurance Association of America.

*Definition of Unearned Premium Reserve*

In making its recommendations with respect to minimum reserve requirements, the Task Force is aware of the possibility that important tax questions may depend upon proper interpretation of the phrase "unearned premium reserve." By actuarial theory and by judicial construction,\* the phrase "unearned premium," when used in connection with guaranteed renewable policies, whether of life insurance or of accident and health insurance, includes not only a pro rata portion of the current premium installment but also any additional reserve made necessary by virtue of restrictions on the insurer's right of termination, and so includes all active life reserves held in accordance with the recommendations of this report. The use of the phrase "unearned premium reserve" to mean "pro rata unearned premiums," as, for example, in the annual statements blanks, should not be construed as implying that other active life reserves are not unearned premiums.

## DISCUSSION OF PRECEDING PAPER

J. RAE JAMIESON:

The authors are to be congratulated for this excellent paper on a timely subject. It will undoubtedly become a standard reference, especially for future students. It is with the thought of the latter in mind that the following discussion is presented. It is my intention to demonstrate one way in which the "weights" shown in the authors' Table E can be obtained.

Let  $x_n$  be the relative claim frequency, expressed as a decimal, of the various surgical procedures, where  $n = 1, 2, \dots, 10$ , signify the ten procedures shown in Table E for Adult Males, and  $n = 11$  signifies all other procedures combined. Thus  $\sum_{n=1}^{11} x_n = 1$ . Let  $B_n$ , where  $n = 1, 2, \dots, 10$ , be the amount payable per \$100 maximum for each of the ten chosen procedures under the "standard" Surgical Schedule (*TSA 1952 Reports, 47-50*). Let  $S$  be the amount that would be obtained if the frequency of each procedure designated by  $n = 11$  were multiplied by the corresponding payment per \$100 maximum under the "standard" schedule and the results were totaled. We thus obtain as a measure of the value of the "standard" schedule the expression

$$\sum_{n=1}^{10} x_n B_n + S.$$

Now, let  $\beta_n$  be the corresponding payments per \$100 maximum for the ten chosen procedures under the schedule to be evaluated, and let  $\sigma$  be the total for all other procedures under the schedule to be evaluated, corresponding to  $S$  for the "standard" schedule. Then the corresponding measure of the value of the schedule to be evaluated is

$$\sum_{n=1}^{10} x_n \beta_n + \sigma.$$

The relative value can be expressed as the ratio

$$r = \frac{\sum_{n=1}^{10} x_n \beta_n + \sigma}{\sum_{n=1}^{10} x_n B_n + S}.$$

If we make the assumption that the ratio of the value of  $S$  to  $\sigma$  for "all other" procedures is the same as the ratio of the value of *all* procedures under the "standard" schedule to the value of *all* procedures under the schedule to be evaluated, then  $\sigma = rS$ . Substituting this expression for  $\sigma$  and simplifying, the terms in  $S$  disappear, and we have

$$r = \frac{\sum_{n=1}^{10} x_n \beta_n}{\sum_{n=1}^{10} x_n B_n}.$$

Hence, the individual "weight" to be applied to each  $\beta_n$  is

$$w_n = \frac{100 x_n}{\sum_{k=1}^{10} x_k B_k},$$

where the factor of 100 is included in order to bring out the final result,  $100r$ , as a percentage rather than a decimal.

\* TASA XLIX, 164-179.

† Average payment, as determined by the authors.

Since the Prudential Schedule used by the authors in their example is identical, for the ten procedures used, to the "standard" schedule, the constants  $B_n$  are the amounts shown in the authors' Table E. The relative frequencies  $x_n$  are obtained by a simple calculation using Table I of the Group Surgical Claims Study, *TASA XLIX*, 164-179. The calculation of the  $w_n$  is shown in the table on page 412.

NIELS H. FISCHER:

We are indebted to the authors of this timely paper for the pioneering work they have performed. Their tables of valuation premiums and commutation functions are, of course, valuable to those of us who will deal with them. The valuation procedures the Prudential contemplates deserve careful consideration by other companies writing this type of business.

Actuaries heretofore unexposed to Hospital and Surgical Expense insurance are doubtless surprised to find that we are dealing with coverages under which the problem of negative reserves is unavoidable. This problem, coupled with the heavy self-selection of benefits which dominates the sale of these coverages, dictates a very conservative underwriting approach. Insurers must particularly avoid offering benefit combinations overbalanced in favor of the benefits which produce negative reserves. A step-rate premium basis will modify the risk of losses due to heavy lapse rates, and will help preserve equity between persisting and terminating policyholders.

An interesting problem arises in connection with the valuation of the Miscellaneous Hospital Expense Benefit available under the Prudential's Family Hospital Expense policies, where the maximum benefit available is a function of the duration of the hospital confinement. The authors related this benefit to the Task Force 4 miscellaneous benefit, under which the maximum does not vary by duration of confinement, by calculating the average maximum benefit available. The accuracy of this method of valuing the benefit is questionable since the problem involved is one of determining the average claim to be paid, rather than the average maximum available. This average claim, when compared to average claims shown in Tables 3 through 12, will determine the proper claim cost. To determine the average claim we must know the distribution by amount of miscellaneous fees charged during actual confinements for each of the durations upon which a different maximum for Miscellaneous Hospital Expense Benefits is based.

Calculation problems similar to the one we encounter here arise in calculating Group Hospital Expense Insurance premiums for "tailor-made" plans; special features of certain Group Comprehensive Medical Expense

plans also call for such claim analyses. At the Aetna we recently tabulated miscellaneous hospital charge distributions by duration of confinement, using recent employee ex-maternity claims arising under our Group Hospital Expense policies. From this study we calculated that the Prudential's Miscellaneous Hospital Expense Benefit is equivalent in average claim cost to a benefit with a maximum, independent of duration of confinement, of \$120. This maximum is 12.8 times the Prudential's average rate of daily benefit of \$9.35, rather than 10.3 times as calculated by the authors.

This figure of 12.8 is based on all ages combined. A further refinement should be made for purposes of reserve calculations in view of the fact that the average duration of hospital confinement increases substantially with age. For the purpose of our comparative calculation, we used Mr. Gingery's continuation table VII-2 as the basis for obtaining a weighted average of expected claims. We then adjusted our figures so as to reproduce Task Force 4 claim costs for a "flat" maximum miscellaneous benefit.

STUART F. CONROD:

The authors are to be congratulated not only for their splendid paper but also on their use of the conventional accident and health notation for the headings to the commutation columns appearing in the paper.

I was particularly interested in the short-cut method to be used by their company in approximating the aggregate reserve for the hospital daily benefit.

While the methods used by our company are not so simple as theirs, they might be of interest to actuaries of companies that have been issuing noncancelable accident and surgical benefits for many years, or who are currently issuing family hospital policies on a true noncancelable or on a guaranteed renewable adjustable basis.

The valuation of closed blocks of business can be simplified by having reserve factors on a per policy (or rider) basis through the use of average hospital and surgical benefits. Moreover, if there is ample margin in the gross premiums the valuation can be still further simplified, and the aggregate reserve liability to be set up on the old business reduced, by using a gross premium valuation method.

Family hospital policies present a problem, particularly if optional benefits of varying amounts are available. The valuation can be simplified by computing reserve factors on a per policy basis by use of composite average benefits. For example, our company issues two noncancelable family hospital policy forms with different terminal ages. Among the optional benefits are miscellaneous hospital expense, surgical and daily

physicians' benefits, and maternity (in one policy form). There is the choice of any one of three surgical schedules and \$3.00 or \$4.00 daily physician's benefit. In addition the policy may also be issued to an individual male or an individual female or it may be issued with different surgical or physicians' benefits on insured and dependents.

To use a separate reserve table for each combination of benefits would require a large number of tables. An alternative would be to value each benefit separately for husband and wife, which in turn would involve a detailed sorting job. We solved the problem to our satisfaction by analyzing our in-force cards and constructing a single composite reserve table for each policy form based on the average male and female content and the average benefits per policy for males and females separately.

SIR GEORGE MADDEX:

What I have to say relates to the experience of a small mutual society in Great Britain insuring civil servants, their wives and children on a voluntary basis, with a total membership of about 8,000 civil servants. It provides mainly for the reimbursement of surgical expenses, the cost of operation and all the incidental expenses.

The benefits with which this paper deals are so different, and the general setup also is so different and complicated, that it is not easy for me to make a comparison between the experience as shown in the paper and the experience we have had in the civil service scheme at home. Therefore, I am limited to looking at what is called the surgical rate to see whether the same sort of picture emerges.

It is very surprising to find that the surgical rate for what I will call the nursing association is much lower throughout than that brought out in the experience in the paper. The paper's rates for men at the younger ages are about four times those we have found in an experience lasting now for nearly 30 years. They fall to about double the rate at the older ages. For women at the younger ages the paper's rates are about three times, falling to about  $2\frac{1}{2}$  times at the older ages. Our range is from about age 20 to age 75, because we permit continuance of insurance after termination of service to an age which has been advanced from time to time as we have found our reserves permitted us to be more generous to members retiring from the civil service.

Now, that to me is an astonishing result, but, of course, in this sort of business the experience rate depends very much on the conditions of insurance. I should have expected, however, that our rates might have been higher than the paper's rates because, although the association has a six months' waiting period, it has rather high limits for the maximum

payments for various classes of surgical operations. Still, I am unable really to comment on that because the conditions are so different.

When one comes to look at the makeup of the weights in Table E of the paper, there are other extraordinary differences. I have had weights calculated on the incidence of cases in the nursing association as compared with the American figures. The results show that while for certain classes such as tumors and nasal septum—using the classification of the paper—there are similarities, there are also wide differences. There is a large excess of appendix operations in the paper, the weight being .7 as against .2 for the association. On the other hand, there is a considerable excess for hernia operations in the association, the weight being about .8 as against .5.

Most striking of all, these being adults, is the rate for tonsils. The class of tonsil operations in the paper is .7, whereas the weight in the nursing association is under .1. I notice that those weights are affected by the maximum, and your limiting figure of \$100 will distort the frequencies. But these differences are so extraordinary that I should like somebody who knows more about it than myself to explain them.

It may be, as regards tonsils, that you do not remove tonsils and adenoids during childhood—but I should have thought that extremely unlikely. In our country there is a virtual disappearance of tonsil operations at the adult ages, but it is apparently a serious problem with you, being the heaviest weight in the experience except for appendix operations.

#### (AUTHORS' REVIEW OF DISCUSSION)

EDWIN L. BARTLESON AND JAMES J. OLSEN

We appreciate very much the valuable comments of those who were kind enough to discuss our paper.

Mr. Conrod's composite reserve factors based on average benefits provide an excellent example of the approximate methods that need to be used to keep the valuation work within reasonable limits. His reference to reducing the reserve by using a gross premium valuation method is not clear. The Task Force 4 recommendations provide that the gross premium method of valuation, as well as other alternative methods, may be used instead of mean reserves, but only if "the reserve on all policies to which the method or basis is applied is not less in the aggregate than the amount determined according to the applicable standards specified above."

Mr. Fischer's report of the Aetna's study of miscellaneous hospital expenses by duration of confinement is very interesting. Any averaging of

averages is open to question, of course, and in this instance it is further complicated by the varying and changing pattern of hospitalization and rising charges. There is relatively less salvage in the maximum for low limits than for higher ones. It was felt desirable to make the adjustments of the Task Force 4 basic tables as simple as possible and on the basis of published material so that they may be used without regard to the individual company's experience. As a matter of fact, our average reimbursement for miscellaneous expenses, under the policy form described in the paper, in 1956 was \$68.72 for men and women combined. This is very close to an average value in respect to the maximum benefit which we used. In contrast to this, the average reimbursement at age 35 is about \$79.00 for a maximum benefit of \$120, which is the maximum amount Mr. Fischer suggested as being more appropriate.

For those persons interested in the origin of the "weights" shown in Table E, Mr. Jamieson has made a useful demonstration
