Actuarial Weather Extremes: November 2021
Extreme Precipitation, Drought and Late Season Tornadoes

Overview
This report examines weather conditions for precipitation, drought conditions, and late season tornadoes that are extreme in an historical context.

Extreme Precipitation in the Pacific Northwest: Many Global Historical Climatology Network (GHCN) stations in Northwest Washington state and Southwest British Columbia had record November daily precipitation amounts on November 14 and 15, 2021 when looking back to 1960. During and after those dates, many U.S. Geological Survey (USGS) stream gage stations in Washington had readouts that were from Flood Stage to Major Flood Stage.

Drought Conditions increase in Continental U.S. as Drought Moves East: Severe drought conditions in the Western U.S. dissipated somewhat, but in the Continental U.S. as a whole, the footprint where drought conditions exist has increased overall, and is driven primarily by increased drought in South-central and Middle Atlantic states.

Late Season Tornado Activity: Comparing the historical database of tornado activity and the recent activity in the state of New York, of 24 November tornadoes reported in New York since 1950, nine occurred on November 13, 2021. These late season tornadoes are rare in New York, and November 2021 was exceptionally active for these storms.
Record November Precipitation

Many GHCN stations in Northwest Washington state and southwest British Columbia had record daily precipitation amounts for November 14 and 15 in 2021, when looking back to 1960, and as seen in Figure 1, one station had more than 11 inches of rain in one day. During and after that time, many Washington stream gage stations had read-outs that were at from Flood Stage to Major Flood Stage (See Figure 2 and Table 1). According to Reuters, some 18,000 people were stranded due to flooding in the Abbotsford, British Columbia area on November 18, in “what could be the costliest natural disaster in Canadian history”. ¹

Drought Conditions Increase in Continental U.S. Overall

As seen in Figure 3, severe drought conditions in the Western U.S. dissipated somewhat, but in the Continental U.S. as a whole, the footprint where drought conditions exist has increased. This is driven primarily by increased drought in South-Central and Middle Atlantic states. The most extreme drought classifications have not changed much overall, but the moderate to severe conditions have expanded materially as shown in the “By Category” portion of Figure 3 below.

The U.S. Drought Monitor is jointly produced by the National Drought Mitigation Center at the University of Nebraska Lincoln, the United States Department of Agriculture, and the National Oceanic and Atmospheric Administration. Map courtesy of NDMC.
Consistent with the precipitation and drought conditions over the month of November, the Continental U.S. stream flow conditions are reflected showing the shifts in highest and lowest percentile stream flows for gages with at least 30 years of data. This can be compared to October 2021 in Figure 4.

USGS STREAMFLOW IN OCTOBER 2021 AND THEN IN NOVEMBER 2021 VS HISTORICAL DATA PERCENTILE CLASSES USING STREAMGAGES WITH AT LEAST 30 YEARS OF DATA

November Tornadoes

Comparing the historical database of tornado activity and the recent activity in the state of New York, of the 24 November tornadoes reported in New York since 1950, nine of them occurred on November 13, 2021 (See Table 2). These late season tornadoes are rare in New York, and November 2021 was exceptionally active for these storms. As reported in the Washington Post, later season warm Atlantic-ocean waters can create fuel for tornado activity, and a longer-term change to this type of climate could lead to a greater incidence of late season tornado activity from the warmer waters which stay warm, even as the daylight wanes late in the season.

Data

Temperature data and Precipitation data used in this report was obtained from the Global Historical Climatology Network ("GHCN") weather database, which provides daily weather observations from over 100,000 weather stations worldwide, covering over 180 countries. The database is publicly available through the National Oceanic and Atmospheric Administration (NOAA) via the following FTP site:

1. Select “List of Sites” in the Major Filters section and enter the Site Number(s) of interest
2. In the Date Ranges section, select “Return all values within an absolute date range” and enter the Date Range of interest
3. For “Parameter Codes”, enter 00060 for Discharge, cubic feet per second or 00065 for Gage Height, feet.
4. At the bottom click “Generate the URL” then click “Run the Generated URL”
About The Society of Actuaries Research Institute

Serving as the research arm of the Society of Actuaries (SOA), the SOA Research Institute provides objective, data-driven research bringing together tried and true practices and future-focused approaches to address societal challenges and your business needs. The Institute provides trusted knowledge, extensive experience and new technologies to help effectively identify, predict and manage risks.

Representing the thousands of actuaries who help conduct critical research, the SOA Research Institute provides clarity and solutions on risks and societal challenges. The Institute connects actuaries, academics, employers, the insurance industry, regulators, research partners, foundations and research institutions, sponsors and non-governmental organizations, building an effective network which provides support, knowledge and expertise regarding the management of risk to benefit the industry and the public.

Managed by experienced actuaries and research experts from a broad range of industries, the SOA Research Institute creates, funds, develops and distributes research to elevate actuaries as leaders in measuring and managing risk. These efforts include studies, essay collections, webcasts, research papers, survey reports, and original research on topics impacting society.

Harnessing its peer-reviewed research, leading-edge technologies, new data tools and innovative practices, the Institute seeks to understand the underlying causes of risk and the possible outcomes. The Institute develops objective research spanning a variety of topics with its strategic research programs: aging and retirement; actuarial innovation and technology; mortality and longevity; diversity, equity and inclusion; health care cost trends; and catastrophe and climate risk. The Institute has a large volume of topical research available, including an expanding collection of international and market-specific research, experience studies, models and timely research.
