

# Society of Actuaries 2015 Risks and Process of Retirement Survey Report of Findings 

# 2015 Risks and Process of Retirement Survey 

## Report of Findings

[^0]
## TABLE OF CONTENTS

INTRODUCTION \& METHODOLOGY ..... 14
EXECUTIVE SUMMARY ..... 17
SURVEY FINDINGS ..... 27
MANAGING RISKS IN RETIREMENT ..... 27
SHOCKS AND UNEXPECTED EXPENSES IN RETIREMENT ..... 68
RETIREMENT PLANNING AND INFLUENCE OF PARENTS ..... 89
INCOME AND SPENDING IN RETIREMENT ..... 116
DEBT ..... 162
CAREGIVING AND FINANCIAL SUPPORT ..... 180
THE PROCESS OF RETIRING ..... 193
TRENDED CORE FINDINGS ..... 206
PROFILE OF SURVEY RESPONDENTS ..... 231
APPENDIX: POSTED QUESTIONNAIRE ..... 235

## INTRODUCTION \& METHODOLOGY

This report presents the results of an online survey of Americans ages 45 to 80 conducted by Mathew Greenwald \& Associates, Inc. on behalf of the Society of Actuaries (SOA). The purpose of the study was to evaluate Americans' awareness of potential financial risks in retirement, how this awareness impacts the management of their finances with respect to retirement, and how Americans are managing the process of leaving the workforce.

This is the eighth study sponsored by the SOA that focuses on these issues. The first was conducted in August 2001, before both the events of Sept. 11 and the subsequent significant declines in investment markets. The second study was conducted in August 2003, the third in June/July 2005, the fourth in June 2007, the fifth in July 2009, the sixth in July 2011, and the seventh in August 2013, during a period of slowly recovering housing values and employment. The eighth study was conducted in July 2015.

The 2015 study includes some of the questions posed in the 2013 study and repeats some questions that were asked in earlier iterations of the survey. Emphasis was placed on questions that focus on unexpected expenses experienced in retirement, income and spending, and debt. Areas of emphasis vary by year, so this report should be considered together with reports from prior years. This report includes some of the repeated questions in the section on trended findings. The same major themes and concerns are found in repeated survey results.

Particular care was taken in 2015 to ensure the income distribution of respondents to the study matched the income distribution of Americans overall ages 45 to 80 . This was done through a combination of fielding targets and weighting. To provide the most accurate comparisons with the results from the 2013 study, the 2013 data were reweighted using the same weighting variables as in 2015. Therefore, the results for 2013 presented in this report may not match data previously reported from this study.

In addition, caution should be exercised when comparing specific numerical results of the 2015 and 2013 studies with the results from questions from earlier iterations of the survey. While the 2015 and 2013 studies were conducted online, all previous studies in the series were conducted by telephone. A test in 2013 comparing online and telephone results for pre-retirees showed that telephone respondents were more likely than online respondents to choose responses at the extremes of attitudinal scales and to respond in what they may have perceived as socially more acceptable ways, such as providing later expected ages for retirement and indicating that they have a financial plan for retirement income and spending. In addition, telephone respondents are less likely than online respondents to select the "don't know" response. Therefore, many of the
differences between 2015 and 2013 findings and the findings from previous years may be the result of the change in survey mode rather than an indication of a true shift in attitudes or behavior of the pre-retiree and retiree populations.

The questionnaire for the study was designed by Greenwald \& Associates, in cooperation with the SOA Committee on Post-Retirement Needs and Risks and its Project Oversight Group appointed by that committee. A total of 2,040 interviews ( 1,035 pre-retirees and 1,005 retirees) lasting an average of 20 minutes were conducted using Research Now's online consumer panel, from July 13 through July 24, 2015. Respondents born between 1935 and 1970 qualified for participation in the study. An additional 198 interviews were conducted among retired widows, and results for these widows are presented in the report where these results differ meaningfully from the results for retirees overall.

As in previous iterations, respondents were classified as retirees if they described their employment status as retiree, had retired from a previous career, or were not currently employed and were either age 65 or older or had a retired spouse. All other respondents were classified as pre-retirees. The questions to determine retiree or pre-retiree status were asked early in the questionnaire.

This study includes pre-retirees and retirees at all income levels. No effort has been made to oversample individuals with high levels of assets. Six percent of pre-retirees and nine percent of retirees report having investable assets of $\$ 1$ million or more.

The sample data are weighted by age, sex, education, and family income to match targets obtained from the March 2014 Current Population Survey (CPS). Additional details about the weighting procedure are available upon request.

No theoretical basis exists for judging the accuracy of estimates obtained from non-probability samples, such as the online sample used for this survey. Most online samples are considered nonprobability samples because selection is not random and the probability that an individual from the target population will be included is unknown. However, there are possible sources of error in all surveys (both probability and non-probability) that may affect the reliability of survey results. These include imperfect sampling frames, refusals to be interviewed and other forms of nonresponse, the effects of question wording and question order, interviewer bias, and screening. While attempts are made to minimize these factors, it is impossible to quantify the errors that may result from them.

This report was prepared by Greenwald and Associates and its content is the responsibility of the firm. Following this introduction is an executive summary. Page numbers are included for each of the highlighted findings so that the corresponding survey results can be easily located in the
body of the report. The subsequent section presents the survey findings for each question asked on the survey. Findings for each question are broken out for both pre-retirees and retirees by household income, age, and gender. Additional breakouts that vary by section are also provided for each question where sample size permits. This is followed by a comparison of the 2015 results to the results from previous iterations of the study (where available) and a demographic profile of the survey respondents. A posted questionnaire, which lists all of the survey questions and tabulated responses, is appended to the end of the report. As with the Executive Summary section, page numbers for locating more detailed survey results are included in the posted questionnaire. Data presented in this report may not total to 100 percent due to rounding or missing categories.

## EXECUTIVE SUMMARY

## MANAGING RISKS IN RETIREMENT

Retirees are faced with many different risks over a long period of time. A major goal of these studies is to understand how retirees perceive post-retirement risks and which ones they view as most important.

- Perhaps because retirement is still in their future, pre-retirees are more likely than retirees to express concern about various retirement risks. This remains true despite the decrease since 2013 in the likelihood of pre-retirees saying they are very concerned about some risk, perhaps due to the improving economy (page 193). Nevertheless, key concerns for both pre-retirees and retirees are being able to afford long-term care ( $69 \%$ of pre-retirees vs. $58 \%$ of retirees), inflation ( $69 \%$ vs. $52 \%$ ), and paying for health care ( $67 \%$ vs. $47 \%$ ). Preretirees also express a high level of concern about maintaining a reasonable standard of living ( $63 \%$ vs $45 \%$ ) and depleting their savings ( $62 \%$ vs. $43 \%$ ) (page 24 ).
- Consistent with the finding from the SOA's focus groups with long-term retirees that widowhood is not usually financially devastating for the surviving spouse, married survey respondents are divided about how the death of one partner would affect the survivor. Married survey respondents are more likely to say their spouse will be better off financially ( $41 \%$ of pre-retirees and $29 \%$ of retirees) rather than worse off ( $12 \%$ and $13 \%$ ) if they predecease their spouse. On the other hand, if their spouse were to predecease them, they are split between whether they would be better off ( $28 \%$ and $21 \%$ ) or worse off ( $15 \%$ and $18 \%$ ) financially. In both situations however, the plurality say their household's financial situation would be unchanged (page 34).
- Both pre-retirees and retirees tend to underestimate average life expectancy, which may mean they are also underestimating their personal life expectancy. Although more than half of pre-retirees ( 55 percent) and retirees ( 57 percent) report knowing someone in their family who lived past age 90 (page 46), most do not expect to live that long. In general, both pre-retirees and retirees predict they will live to age 85 (median) (page 42). This is typically at or above respondents' own estimate of average life expectancy, but it is well below actuarial estimates for people their age in the general population. More than half ( $55 \%$ ) of both pre-retirees and retirees cite estimates of personal life expectancy below actuarial estimates. Two in ten identify an age that is roughly on target ( $21 \%$ of pre-retirees and $22 \%$ of retirees) (figure 34).
- Pre-retirees and retirees continue to rely on increasing savings, reducing debt, and decreasing spending to manage retirement risks. Large majorities say they have already saved or plan to save as much money as possible ( $90 \%$ of pre-retirees and $74 \%$ of retirees). Similarly, most have already eliminated or plan to eliminate their consumer debt ( $88 \%$ and $86 \%$ ) and cut back or plan reductions in spending ( $81 \%$ and $76 \%$ ) (page 52).
- Sizeable portions of pre-retirees expect to work in retirement or postpone retirement, far outstripping the portions of retirees who have actually enacted these strategies. Seven in ten ( $68 \%$ ) pre-retirees plan to work in retirement as a risk management strategy, while almost half ( $46 \%$ ) plan to or have postponed retirement. In contrast, just 30 percent of retirees report using the work-in-retirement strategy, while only 12 percent have tried to postpone retirement (page 52).
- Risk pooling strategies for managing financial risks are not popular. Only about onethird ( $33 \%$ ) of pre-retirees and two in ten ( $22 \%$ ) of retirees have already purchased a product or chosen (or plan to purchase or choose) an employer plan option that will provide them with guaranteed income for life. Moreover, while half ( $50 \%$ ) of pre-retirees say they will postpone taking Social Security, just 13 percent of retirees report having done so (page 52). (Another seven percent of retirees say they plan to postpone taking Social Security.)
- Lower-income pre-retirees and retirees are more likely to express concern about retirement risks. Reported concern about most retirement risks increases as household income decreases (figure 2). Lower-income pre-retirees and retirees also tend to rely heavily on the strategy of cutting back on spending to manage risk (figure 54).

## SHOCKS AND UNEXPECTED EXPENSES IN RETIREMENT

A new topic in 2015, this study delved into the shocks and unexpected expenses encountered by retirees and how experiencing these events impacted them financially.

- Most retirees report having experienced one or more shocks since they retired. The types of shocks and unexpected expenses most often reported by retirees include major home repairs and upgrades ( $28 \%$ ), major dental expenses ( $24 \%$ ), and significant out-of-pocket medical and prescription expenses (20\%) (page 63). While three in ten retirees ( $28 \%$ ) report experiencing none of the shocks or unexpected expenses listed in the study, 13 percent say they encountered three types of shocks in retirement and 19 percent encountered four or more. One-quarter ( $24 \%$ ) of retired widows indicate they have encountered four or more (page 70).
- The financial consequences of these shocks vary. In general, the more shocks retirees encounter, the more profound the consequences. Four in ten (40\%) of retirees experiencing three or more shocks, compared with 8 percent of those encountering one or two, say that their assets have been reduced by 50 percent or more (figure 81). Similarly, those experiencing three or more shocks are more likely to indicate they have reduced their
spending by at least 50 percent ( $27 \%$, compared with $4 \%$ of those experiencing one or two shocks) (figure 87).
- Nevertheless, retirees are resilient. The large majority of retirees who have had to reduce their spending as a result of the shocks they have experienced indicate they have learned to manage at least somewhat well within their new financial constraints. Only one-quarter $(25 \%)$ say they have not been able to manage well ( $35 \%$ of those experiencing three or more shocks) (page 77).
- Despite the fact that many of the shocks, such as major home repairs, can be anticipated, most retirees do not believe there is anything they could have done to limit the financial impact of the shocks they experienced in retirement. Six in ten (60\%) retirees do not believe there is anything they could have done ahead of time. Only a handful 8 percent - strongly agree that there was something they could have done (page 79).
- Lower-income retirees are more likely to report having experienced some shocks than higher-income retirees (figure 66). They are also more likely to report negative financial consequences as a result of the shocks (figure 77).

## RETIREMENT PLANNING AND INFLUENCE OF PARENTS

While this study has asked questions about retirement and financial planning before, another new topic for the 2015 iteration was how the experiences of parents in retirement affects the way their children plan for retirement.

- The median financial planning for both pre-retirees and retirees remains unchanged at just 10 years. However, one in ten do not think ahead at all ( $10 \%$ of pre-retirees and $11 \%$ of retirees) and three in ten say they haven't thought about it ( $28 \%$ and 29\%) (page 83).
- Many never consult a financial planner or advisor. Fifteen percent of pre-retirees and 20 percent of retirees report having consulted with a professional financial planner or advisor at least once a year for help with decisions about retirement and financial planning. Another quarter each do so as needed ( $23 \%$ each), while about one in ten consult a financial professional less than once a year ( $11 \%$ of pre-retirees and $6 \%$ of retirees). However, half say they have never consulted a financial planner or advisor ( $51 \%$ each) (page 86).
- Most pre-retirees and retirees report a positive view of their parents' financial circumstances in retirement. They describe their parents' financial circumstances in retirement as very comfortable ( $23 \%$ of pre-retirees and $19 \%$ of retirees) or comfortable ( $44 \%$ and $43 \%$ ). Only one-quarter say their parents' lifestyle was restricted ( $23 \%$ and $25 \%$ ) (page 89). (One in ten state this question does not apply.)
- Pre-retirees and retirees are more likely to say their parents had experienced many of the shocks and unexpected expenses in retirement than retirees are to have encountered them so far in their retirement. This is likely because many of these parents had already lived the entirety of their retirement, while the age for participation in the survey was capped
at 80 . Most notably, they are more likely to say their parents suffered an illness or disability ( $43 \%$ of pre-retirees and $58 \%$ of retirees), went on Medicaid ( $34 \%$ and $23 \%$ ), and suffered a loss of capacity requiring someone outside the household to manage their money ( $14 \%$ and 24\%) (page 92).
- Most also have an optimistic view of their parents' ability to adjust to shocks. Overall, pre-retirees and retirees feel their parents adjusted very well ( $42 \%$ of pre-retirees and $40 \%$ of retirees) or somewhat ( $43 \%$ and $48 \%$ ) well to the shocks and unexpected expenses they experienced. Just 15 percent of pre-retirees and 11 percent of retirees think their parents did not adjust well (page 100).
- Nevertheless, many report increased concern about their financial security in retirement as a result of their parents' experiences. Both pre-retirees and retirees are more likely to say their parents' experiences in retirement have made them more concerned about their financial security in retirement ( $46 \%$ of pre-retirees and $42 \%$ of retirees) than they are to say it has made them less concerned ( $10 \%$ and $8 \%$ ) (page 104). Among those more concerned, the large majority report those experiences have impacted their own preparations for retirement either a great deal ( $39 \%$ of pre-retirees and $33 \%$ of retirees) or some ( $45 \%$ each) (page 106).
- Perhaps because they have fewer assets to manage, lower-income pre-retirees and retirees are less likely to engage in financial planning. They are less likely than higherincome pre-retirees and retirees to consult with a financial planner (figure 109), and are more likely to say they don't plan ahead or haven't thought about planning ahead (figure 103). They are also less likely to have a plan for managing their assets (figure 160) or for income and spending (figure 173).

## INCOME, SPENDING, AND DEBT IN RETIREMENT

During retirement, the income sources that most people rely on before retirement are no longer available. Spending can also be affected as people try to conserve assets. A focus of this year's study is to understand spending and debt in retirement.

- There is a strong preference for maintaining - or increasing - asset levels in retirement. The most common retirement asset management strategy is maintaining financial assets by withdrawing only earnings and leaving the principal intact ( $32 \%$ of both pre-retirees and retirees). About one-quarter try to grow their assets ( $27 \%$ of pre-retirees and $22 \%$ of retires), but only two in ten plan to spend down their assets ( $17 \%$ and $22 \%$ ). The remainder ( $23 \%$ and $24 \%$ ) have no plan for how they will manage their assets in retirement (page 116).
- Retirees tend to report asset levels are as expected at this point in their retirement. Onethird ( $32 \%$ ) say their current levels of savings and investments at this point in time are lower than they expected when they first retired, while two in ten $(21 \%)$ state they are higher than expected (page 120).
- Many pre-retirees are optimistic about their ability to decrease their expenses once they retire. Four in ten (43\%) pre-retirees think their expenses in early retirement will be below pre-retirement levels, compared with just 17 percent who think expenses will be higher in retirement (page 125). To some extent, this tracks with the experience of retirees. Retirees tend to decrease their spending in retirement ( $49 \%$ ), including two in ten who report decreasing their spending a lot ( $18 \%$ ). Just two in ten ( $18 \%$ ) say their level of spending has increased since they first retired (page 130).
- Retirees often find their expenses in retirement are higher than they anticipated they would be when they first retired, causing them to make a conscious effort to reduce expenses. Approximately four in ten retirees (38\%) and retired widows (44\%) say their expenses in retirement have been higher than expected (page 127). This may explain why more than eight in ten (83\%) retirees with decreased spending have made a conscious effort to reduce expenses (page 135), typically by spending less on purchases ( $90 \%$ ), eating out less often ( $70 \%$ ), spending less on travel (56\%), and reducing gifts or charitable giving (44\%) (page 137).
- Pre-retirees are more optimistic than retirees about their ability to reduce expenses as they age. Nearly six in ten (58\%) pre-retirees expect their spending to decrease as they age in retirement. In contrast, the plurality ( $40 \%$ ) of retirees say their spending will stay the same as they age. Just over one-third (36\%) of retirees think it will decrease, while two in ten (20\%) think it will increase (page 142). This may be because pre-retirees in particular may try to limit their spending to preserve assets. Three-quarters ( $77 \%$ ) of pre-retirees think the need to preserve assets will cause them to limit their spending in retirement a great deal or somewhat, compared with 55 percent of retirees (page 145).
- Pre-retirees are more likely than retirees to hold debt. The most common types of debt held by pre-retirees and retirees are mortgages ( $52 \%$ of pre-retirees and $30 \%$ of retirees), credit card debt ( $48 \%$ and $35 \%$ ), and car loans ( $40 \%$ and $24 \%$ ) (page 152). Almost three in ten ( $28 \%$ ) pre-retirees with debt report carrying at least $\$ 30,000$ in debt, excluding any mortgage. Another third ( $34 \%$ ) carry between $\$ 10,000$ and $\$ 29,999$. Retirees tend to carry lower levels of debt, with half (52\%) indicating their debt totals to less than \$10,000 (page 162).
- Likely due to their lower levels of debt, retirees are less likely than pre-retirees to experience negative consequences. More than half of pre-retirees with debt state it has negatively impacted, either a great deal (28\%) or somewhat (28\%), how much they are able to put away each month in savings and investments. Only two in ten (22\%) say their debt has not impacted their ability to save. In contrast, many retirees with debt feel it has little ( $28 \%$ ) or no $(36 \%)$ impact on their ability to maintain their desired lifestyle. Just 15 percent report it has a great deal of impact (page 165).
- Lower-income retirees are more likely than their higher-income counterparts to report negative financial experiences in retirement. They are more likely to say their financial
assets are much lower than expected at this point in their retirement (figure 167), their spending has decreased a lot (figure 186), and that their level of spending is more than they can afford (figure 197).

## CAREGIVING AND FINANICAL SUPPORT

Caregiving in retirement can be a source of stress, affecting both physical and financial health.
More directly, the need to provide financial support to others can also drain financial resources.

- Sizable minorities of retirees and pre-retirees have (or expect to) spend time caring for others in retirement. Retired widows (52\%) are more likely than either retirees (37\%) or pre-retirees ( $32 \%$ ) to report they have spent time (or expect to spend time) caring for others in retirement (page 169). Most frequently, these pre-retirees and retirees expect to provide or have provided the following types of care: checking in regularly to see how the care recipient is doing ( $83 \%$ of pre-retirees and $70 \%$ of retirees), helping with household chores ( $82 \%$ and $59 \%$ ), providing transportation ( $80 \%$ and $70 \%$ ), and communicating with healthcare professionals on the recipient's behalf ( $65 \%$ and $56 \%$ ) (page 172).
- Pre-retirees are more than twice as likely as retirees to provide financial support to others. Three in ten (30\%) pre-retirees, but only about one in ten (13\%) retirees, are currently providing financial support for someone other than themselves and their spouse/partner (page 177). Pre-retirees providing financial support most often do so to children under 21 ( $57 \%$ ), while retirees most often provide this type of support to older children (57\%). More than one in ten each provide financial support to parents or parents-inlaw ( $13 \%$ of pre-retirees and $14 \%$ of retirees) and one-quarter ( $24 \%$ ) of retirees support their grandchildren financially (page 179).

## THE PROCESS OF RETIRING

How and when Americans retire is critical to their welfare later in life. This study offers a look at when people retire and their reasons for working longer than preferred.

- Consistent with previous iterations of this study, pre-retirees report they expect to retire at an older age than retirees actually retire. The median age of retirement reported by retirees is 60 , while pre-retirees expect to retire five years later, at a median age of 65 . Fourteen percent of pre-retirees indicate they will never retire (page 181).
- While retirees indicate they retired earlier than they would have preferred, pre-retirees are generally planning to work beyond their preferred retirement age. Both pre-retirees and retirees report they would prefer (or have preferred) to retire at about age 62 (median) (figure 303). For 44 percent of pre-retirees, this means they will retire at least five years later than they would like.
- Financial reasons play a large role in postponing retirement. Pre-retirees and retirees who retired (or plan to retire) later than preferred say major reasons for doing so is that they
do/did not have enough money to retire ( $71 \%$ of pre-retirees and $37 \%$ of retirees), want/wanted to continue building their assets ( $69 \%$ and $51 \%$ ), and keeping employerprovided health benefits ( $50 \%$ and $34 \%$ ). Moreover, pre-retirees are far more likely than retirees to select each of these reasons for working longer than preferred (page 189).

## DIFFERENCES BY POPULATION SUBGROUP

This section summarizes meaningful differences by population subgroup. Detailed tabulations by subgroup are shown in the subsequent sections describing individual questions.

## Differences by Household Income

- Differences in responses by household income status are dramatic although they reveal few surprises. As in previous years, both retirees and pre-retirees with lower household income are more likely than those with higher income to be concerned about most retirement risks.
- Affluent retirees and pre-retirees tend to use different risk management strategies than do those who are less affluent. Cutting back on spending is a preferred strategy among those with lower household income, while the probability of eliminating consumer debt, saving as much as possible, investing in stocks or stock mutual funds, moving assets into more conservative investments, or paying off the primary home mortgage increases as household income increases (figure 54).
- The likelihood of retirees reporting they experienced some shocks, such as running out of assets or going on Medicaid, is higher among those with household income under $\$ 35,000$ than among more affluent retirees (figure 66). Lower income retirees who have experienced shocks are also more likely to report reduced assets and spending as a consequence (figure 77). However, it is difficult to establish from this study whether these retirees had less than $\$ 35,000$ in household income prior to experiencing these shocks or whether they fell into this category as a result of the shocks.
- Lower-income pre-retirees and retirees are less likely than their more affluent counterparts to anticipate receiving or receive income from the following sources: employer-sponsored retirement savings plan, IRA, defined benefit plan, taxable investment or bank accounts, and rental property or real estate (figure 151).
- Perhaps not surprisingly, retirees with household income under $\$ 35,000$ are more apt than higher-income retirees to state that their assets are lower than expected at this point in their retirement (figure 167) and their expenses are higher (figure 185), leading many to spend more than they can afford (figure 197). Because their spending is already so low, they are especially likely to find further reductions in spending difficult (figure 214).
- On average, pre-retirees with lower household income plan to retire at an older age than those with higher income. Lower-income pre-retirees are also more likely than higher-
income pre-retirees to state they do not expect to retire. Similarly, lower-income retirees tend to have retired at a slightly older age than did higher-income retirees (figure 297).

## Differences by Sex

- The study results show few differences by gender, and those differences that exist tend to be small.
- Female pre-retirees and retirees estimate a slightly higher average life expectancy than do their male counterparts (figure 28).
- Male pre-retirees and retirees are more likely than females to plan to spend down their assets in retirement (figure 161).
- Female pre-retirees are more likely than male pre-retirees to expect to provide care to someone at some point in their retirement (figure 276). They are also more likely to indicate they are currently providing financial support to someone outside their household (figure 288).

## Differences by Age

- Differences in responses by age, particularly among pre-retirees, tend to mirror differences between pre-retirees and retirees. For example, younger pre-retirees and retirees are more likely than their older counterparts to indicate they are very or somewhat concerned about health care, maintaining a reasonable standard of living, and depleting savings (figure 3).
- Younger retirees who have experienced shocks in retirement are more apt than older retirees to report their assets and spending have been substantially reduced as a result (figures 78 and 84).
- Younger retirees are also more likely than older retirees to say they typically spend more than they can afford (figure 198).

## SURVEY FINDINGS

## MANAGING RISKS IN RETIREMENT

Retirees are faced with many different financial risks over the long period of their retirement. This section looks first at perceptions of retirement risks (a question asked on every iteration of the study), expected effect of inflation, and expected longevity. It then delves into the riskmanagement strategies of pre-retirees and retirees.

Though the exact order may vary, long-term care, inflation, and health care continue to head the list of retirement risks that pre-retirees and retirees are concerned about. Concern among preretirees has decreased slightly since 2013, but changes in concern among pre-retirees have been observed in other iterations of the study in response to changing economic conditions. Preretirees remain more likely than retirees to state they are concerned about many of these risks.

At the same time, the strategies pre-retirees and retirees turn to most often to manage the risks associated with retirement remain unchanged. Consistent with the results from previous iterations of the study and with the 2015 focus groups conducted among long-term retirees, both pre-retirees and retirees most report saving more, reducing spending, and reducing debt to manage retirement risks.

## Concerns in Retirement

Paying for long-term care, inflation, and paying for health care are the top ranked retirementrelated concerns for both pre-retirees and retirees. However, pre-retirees are more likely than retirees to express concern about many of the retirement risks listed in the survey, including paying for long-term care ( $69 \%$ of pre-retirees vs. $58 \%$ of retirees), inflation ( $69 \%$ vs. $52 \%$ ), paying for health care ( $67 \%$ vs. $47 \%$ ), maintaining a reasonable standard of living ( $63 \%$ vs $45 \%$ ), and depleting savings ( $62 \%$ vs. $43 \%$ ).

Figure 1: Concerns in Retirement
How concerned are you about each of the following (during retirement)?

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Expected Effect of Inflation

Although the majority of both pre-retirees $(76 \%)$ and retirees ( $66 \%$ ) think inflation will affect the amount of money they need each year in retirement at least somewhat, only about one-quarter think it will do so a great deal.

Figure 7: Expected Effect of Inflation
Over the course of your retirement, how much do you think inflation will affect the amount of money you will need each year in retirement?

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

Expected Financial Consequences of Death of Spouse

Roughly half of married pre-retirees and retirees think it would have little effect on their finances if their spouse were to predecease them. However, four in ten married pre-retirees think their spouse would be better off financially if they were to pre-decease their spouse.

Figure 13: Expected Financial Consequences of Death of Respondent (on Spouse) If you were to pass away before your (spouse/partner), do you think it would leave your (spouse/partner) financially better off, about the same, or worse off? (If married/living with partner)

Figure 14: Expected Financial Consequences of Death of Spouse (on Respondent)
If your (spouse/partner) were to pass away before you (in retirement), do you think it would leave you financially better off, about the same, or worse off?[If married/partner]

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Estimate of Average Life Expectancy

Pre-retirees estimate the average person their age and gender can expect to live to age 83 (median). Retirees feel the average person their age and gender can expect to live to age 85 (median). This means that many underestimate life expectancy based on actuarial tables.

Figure 25: Estimate of Average Life Expectancy
Knowing how long you can expect to live can be important for retirement planning. Until what age do you think the average person your age and gender can expect to live?

Figure 26: Difference between Respondent and Actuarial Estimate of Average Life
Expectancy (if provided average life expectancy)

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Estimate of Personal Life Expectancy

Both pre-retirees and retirees expect to live until about age 85 (median). While this is slightly above pre-retiree estimates of average life expectancy, it is still below the life expectancy predicted by actuarial tables. Although not visible in the graphs presented, most pre-retirees and retirees round to the nearest age ending in a zero or five when stating life expectancy ( 80,85 , etc.). This can be an advantage if it encourages individuals to plan for one or two more years than they otherwise would, but it could also cause people to slightly underestimate the number of years they need to plan for in retirement.

Figure 32: Estimate of Personal Life Expectancy
Until what age do you think that you can expect to live?

Figure 33: Difference between Respondent Estimates of Personal and Average Life Expectancy (if provided average and personal life expectancy)

## Age of Death for Longest-Living Relative

Despite saying they themselves are only likely to live until about age 85 (median), a majority of pre-retirees and retirees have at least one relative who lived into their 90 s. Moreover, 37 percent of pre-retirees and 28 percent of retirees report they expect to live 10 years less than their longest living relative.

Figure 40: Age of Death for Longest-Living Relative
Please think about the person you knew in your family who lived the longest. How old were they when they died? If this person is still living, please enter their current age.

Figure 41: Difference between Personal Life Expectancy and Age of Longest-Living
Relative (if provided both personal life expectancy and age of longest living relative)

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Main Reasons Given for Estimate of Personal Life Expectancy

Despite typically identifying a lower personal life expectancy than their longest-living relative, half of retirees and pre-retirees cite family history as a main reason for their estimate.
Approximately three in ten each name their own health, healthy lifestyle habits, and a positive attitude as reasons for their estimate.

Figure 47: Main Reasons for Estimate of Life Expectancy
What are the main reason(s) you think you will live until that age? (Choose up to two reasons)(if provided personal life expectancy)

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Risk Management Strategies

Consistent with previous iterations of this survey, the most popular risk management strategies remain trying to save as much as possible, eliminating all consumer debt, cutting back on spending, and paying off any mortgage. Among pre-retirees, many also plan to work in retirement (68\%), a strategy that only a minority of retirees have implemented (17\%) or plan to implement (13\%).

Figure 53: Risk Management Strategies
Have you (and your spouse/partner) done the following to protect yourselves financially, plan to do it in the future, or have no plans to do it?

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Likely Strategies if Running Out of Money

If they found themselves running out of money in retirement, both pre-retirees and retirees report they would likely reduce their expenditures significantly. Other likely tactics would include downsizing housing, dipping into money that otherwise might have been left to heirs, and using the value of their home. A majority of pre-retirees, but not retirees, also say they would return to work or increase the number of hours worked.

Figure 59: Likely Strategies if Running Out of Money
If you (and your spouse/partner) were running out of money (in retirement) due to unforeseen circumstances, how likely do you think you would be to do each of the following?

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## SHOCKS AND UNEXPECTED EXPENSES IN RETIREMENT

Retirees often encounter shocks and unexpected expenses during retirement. This section examines the types of shocks and unexpected expenses that retirees have encountered to date and the effect of these shocks on their finances.

While this is the first time these questions have been asked and therefore no trend data are available, the results of the survey are very similar to the findings from the SOA's 2015 focus groups conducted among long-term retirees. Both studies highlight the resilience of retirees and their ability to make do within their changing financial constraints.

## Types of Shocks and Unexpected Expenses Experienced During Retirement

The types of shocks and unexpected expenses most often reported by retirees include major home repairs and upgrades ( $28 \%$ ), major dental expenses ( $24 \%$ ), and significant out-of-pocket medical and prescription expenses ( $20 \%$ ). Other types of unexpected expenses are reported by less than two in ten retirees each. Not unexpectedly, more than half of retired widows (56\%), but just one in ten retirees overall ( $10 \%$ ), reported the death of a spouse or partner during retirement. (Some retired widows included in the survey may have lost their spouse prior to retirement.)

Figure 65: Shocks Experienced During Retirement
Have you (or your spouse/partner) experienced any of the following during retirement?

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Number of Shocks/Unexpected Expenses Experienced in Retirement

While almost three in ten retirees ( $28 \%$ ) report experiencing none of these shocks or unexpected expenses, 13 percent say they encountered three and 19 percent encountered four or more in retirement. One-quarter of retired widows ( $24 \%$ ) indicate they have encountered four or more.

Figure 71: Number of Shocks Experienced in Retirement

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Effect of Shocks/Unexpected Expenses on Assets

Most retirees who have experienced these events report little or no reduction in their assets as a result, but more than two in ten have experienced a significant reduction, reporting a loss of 50 percent or more of their assets.

Figure 76: Effect of Shocks on Assets
By approximately how much, if at all, did these events reduce your level of assets? (excludes those who have not experienced any shocks)

## Effect of Shocks/Unexpected Expenses on Spending

Six in ten retirees who have experienced shocks report some reduction in spending power as a result. Four in ten $(41 \%)$ report the amount of money they are able to spend has been reduced by at least $10 \%$, including 14 percent who say their spending has been reduced by 50 percent or more as a result of the shocks they have experienced in retirement.

Figure 82: Effect of Shocks on Spending
By approximately how much, if at all, did these events reduce the amount of money you (and your spouse/partner) are able to spend each month? (excludes those who have not experienced any shocks)

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Ability to Manage Within New Constraints

The large majority of retirees who have had to reduce their spending as a result of shocks indicate they have learned to manage at least somewhat well within their new financial constraints. Only one-quarter say they have not been able to manage well.

Figure 88: Ability to Manage Within New Constraints
How well have you been able to manage within these new financial constraints? (Among those who have reduced spending as a result of shocks)

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Ability to Protect Against Shocks

Six in ten retirees do not believe there is anything they could have done to limit the financial impact of the shocks they experienced in retirement. Only a handful - 8 percent - strongly agree that there was something they could have done ahead of time.

Figure 94: Ability to Protect Against Shocks
To what extent do you agree or disagree that there was something you could have done ahead of time to lessen the financial impact of these events? (excludes those who have not experienced any shocks)

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Planning for Death of a Spouse

While a majority of retired widows at least considered how they would respond in the event of their spouse's death, less than four in ten say they planned with their spouse for that possibility.

Figure 100: Planning for Death of Spouse
Did you and your spouse consider and plan for how you would respond if you lost your spouse? (if retired widow)

## Sources of Support in Widowhood

More than four in ten retired widows report they have turned to family members for assistance and support (financial and non-financial) since their spouse died. One-third say they turned to friends. However, more than four in ten indicate they did not use any of the sources of assistance listed in the survey.

## Figure 101: Sources of Support

Which of the following sources of assistance and support (financial and non-financial) have you turned to since your spouse died? (Select all that apply.) (if retired widow)

## RETIREMENT PLANNING AND INFLUENCE OF PARENTS

With retirements lasting 30 or even 40 years, planning for retirement and financial planning is critical to maintaining a comfortable retirement. This section examines people's planning horizon and how their parents' financial circumstances in retirement impact their own planning. While the question regarding planning horizons has been asked before with similar results, the remainder of this section is new to this study.

## Planning Horizon

For both pre-retirees and retirees, the time horizon for financial planning is about 10 years (median). However, roughly one in ten don't plan ahead at all and three in ten say they haven't thought about it.

Figure 102: Planning Horizon
When you (and your spouse/partner) make important financial decisions (such as whether you can afford to retire or to purchase a new home / such as your retirement finances or a large purchase), about how many years do you look into the future?

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Consultation with Financial Advisor

Fifteen percent of pre-retirees and 20 percent of retirees report having consulted with a professional financial planner or advisor at least once a year for help with decisions about retirement and financial planning. Another quarter each do so as needed, while about one in ten consult a financial professional less than once a year. However, half of pre-retirees and retirees say they have never consulted with a financial planner or advisor.

Figure 108: Consultation with Financial Advisor
About how often do you (and your spouse/partner) consult with a professional financial planner or advisor who helps you make decisions about your (retirement / financial) planning?

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Parents Financial Circumstances in Retirement

Most pre-retirees ( $67 \%$ ) and retirees ( $62 \%$ ) describe their parents' financial circumstances in retirement as very comfortable or comfortable. One-quarter each say their parents' lifestyle was restricted. (One in ten state this question does not apply.)

Figure 114: Parents' Financial Circumstances in Retirement
How would you describe your parents' financial circumstances in retirement?

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Parents' Experience of Shocks and Unexpected Expenses in Retirement

Pre-retirees and retirees were asked whether their parents had experienced various shocks and unexpected expenses in retirement. Perhaps because many of these parents had already lived the entirety of their retirement, people were more likely to say their parents had experienced many of these shocks than retirees are to have encountered them so far in their retirement. Most notably, they are more likely to say their parents' suffered an illness or disability ( $43 \%$ of pre-retirees and $58 \%$ of retirees), went on Medicaid ( $34 \%$ and $23 \%$ ), and suffered a loss of capacity requiring someone outside the household to manage their money ( $14 \%$ and $24 \%$ ).

Figure 120: Parents' Experience of Shocks in Retirement
To the best of your knowledge, did either of your parents experience any of the following during retirement?

Figure 121: Comparison of Retirees' and Parents' Experience

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Ability of Parents to Adjust to Shocks/Unexpected Expenses

Overall, pre-retirees and retirees feel their parents adjusted well to the shocks and unexpected expenses they experienced. Just 15 percent of pre-retirees and 11 percent of retirees think their parents did not adjust well.

Figure 127: Ability of Parents to Adjust to Shocks
Overall, how well do you think your parents adjusted financially to these events during retirement?

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Financial Support to Parents

Only a small minority of pre-retirees and retirees provide (or have provided) regular or occasional financial support to their parents during their retirement. More than eight in ten each report they did not provide any financial support.

Figure 133: Financial Support to Parents
Did you provide or are you providing financial support to your parents during their retirement?

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Effect of Parents' Experience in Retirement

Both pre-retirees and retirees are more likely to say their parents' experiences in retirement have made them more concerned about their financial security in retirement than they are to say it has made them less concerned. Nevertheless, about half of retirees and four in ten pre-retirees believe observing their parents in retirement has not affected their level of concern.

Figure 139: Effect of Parents' Experience
On the whole do you think your parents' experiences made you more or less concerned about your financial security in retirement?

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Influence of Parents' Experience on Retirement Planning

Among pre-retirees and retirees who are more concerned about their financial security in retirement due to their parents' experiences, the large majority report those experiences have impacted their own preparations for retirement either a great deal or some. About two in ten each indicate their parents' experiences have influenced their planning only a little or not at all.

Figure 144: Influence on Retirement Planning
To what extent, if at all, do you think your parents' experiences (have influenced how you plan or prepare / influenced how you planned or prepared) for your own retirement? (if more concerned about financial security in retirement due to parents' experience)

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Event with Greatest Influence on Retirement Planning

Among those saying their parents' experiences in retirement influenced their own planning a great deal, there is considerable variation in the events pre-retirees and retirees report as having the greatest influence on how they plan or planned for retirement, with no one experience or event predominating. The plurality of pre-retirees cite their parents doing poorly in retirement (not having enough money, having debt, poor planning, etc.), while the plurality of retirees mention health issues.

Figure 149: Event with Greatest Influence on Retirement Planning
What single experience or event had the greatest influence on how you (plan/planned) or (prepare/prepared) for your own retirement? (if parents influenced planning a great deal)

## INCOME AND SPENDING IN RETIREMENT

The income sources that people most often rely on in their pre-retirement years - paid employment - is often not available during retirement, making income management more difficult. This section examines sources of income in retirement, financial assets, expectations and experiences regarding expenses, and actions taken to reduce spending. Where meaningful differences are found, it also includes data for retired widows.

Questions about sources of income in retirement have been asked in previous iterations of this study with similar results. However, many of the questions about spending are new to this 2015 iteration of the study.

## Sources of Income in Retirement

The most common expected/actual source of income in retirement is Social Security ( $92 \%$ of pre-retirees and retirees). Pre-retirees expect to receive income from employer-sponsored retirement savings plans more so than retirees ( $64 \%$ of pre-retirees and $37 \%$ of retirees), while the opposite is true of pension plans ( $46 \%$ and $53 \%$ ). Pre-retirees are more than twice as likely as retirees to expect income from work in retirement ( $54 \%$ and $21 \%$ ).

Figure 150: Expected/Actual Sources of Income in Retirement
Which of the following (do you expect will be / are) sources of income for your (and your spouse's/partner's) retirement?

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Required Minimum Distributions

More than four in ten retirees age 70 or older report having funds in a 401(k), 403(b), IRA, or other retirement plan from which they must take a required distribution. Use of the distribution varies, with about half spending some or all of the money, slightly fewer saving or investing it, and one-quarter using the money to pay taxes.

Figure 157: Required Distributions
Do you have any funds in a 401(k), 403(b),IRA, or other retirement plan from which you must take a required monthly distribution? (if retiree and age 70+)

Figure 158: Use of Required Distributions
How do you typically use the money from your required monthly distribution(s)? (Select all that apply.) (if required to take a distribution from retirement plan)

## Managing Financial Assets

One-third of pre-retires and retirees plan to maintain their financial assets by withdrawing only earnings and leaving the principal intact. Somewhat fewer plan to grow their assets by accumulating earnings or saving more money. The least popular strategy for managing assets is spending them down, a tactic chosen by roughly two in ten pre-retirees and retirees.

Figure 159: Managing Financial Assets
Which one of the following best describes how you plan to manage your financial assets (in retirement)?

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

Figure 160: Managing Financial Assets, by Household Income

|  | $\begin{array}{c}\text { None } \\ (\mathrm{n}=272)\end{array}$ | $\begin{array}{c}1-2 \\ (\mathrm{n}=417)\end{array}$ | $\begin{array}{c}3+ \\ (\mathrm{n}=316)\end{array}$ |
| $\begin{array}{l}\text { You plan to maintain your financial assets by } \\ \text { withdrawing only earnings and leaving the principal intact }\end{array}$ | $35 \%^{\mathrm{c}}$ | $(\mathrm{a})$ | $37 \% \mathrm{c}^{\mathrm{c}}$ |$]$

## Level of Financial Assets

Retirees are more likely to say their current levels of savings and investments at this point in time are lower than they expected when they first retired ( $32 \%$, compared with $21 \%$ higher than expected). However, nearly half report their assets are about where they anticipated they would be.

Figure 166: Level of Financial Assets
Compared with what you expected when you first retired, would you say your current levels of savings and investments at this point in time are higher than expected, about the same as expected, or lower than expected? (if retiree)

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

Figure 167: Level of Financial Assets, by Household Income

## Plan for Income and Spending

Six in ten retirees state they have a plan for how much money they will spend each year in retirement and where that money will come from. In contrast, only four in ten pre-retirees indicate they have an income and spending plan for retirement.

Figure 172: Plan for Income and Spending
Do you currently have a plan for how much money you will spend each year in retirement and where that money will come from?

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

Figure 173: Plan for Income and Spending, by Household Income

## Expectation for Expenses in Early Retirement

Pre-retirees are more than twice as likely to think their expenses in early retirement will be below pre-retirement levels as they are to think their expenses will be higher ( $43 \%$ vs. $17 \%$ ). More than one-third say their expenses will stay about the same.

Figure 179: Expectation for Expenses in Early Retirement
Compared with your expenses in the five years before you retire, do you expect your expenses in the first five years of your retirement will be higher, about the same, or lower? (if worker)

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Experience with Expenses in Retirement

Compared with what they expected when they first retired, retirees often find their expenses in retirement are higher than they expected ( $38 \%$ ). Retired widows are especially likely to find their expenses higher than expected (44\%). Few find their expenses are lower than anticipated ( $12 \%$ each of retirees and retired widows).

Figure 184: Experience with Expenses in Retirement
Compared with what you expected when you first retired, would you say your expenses in retirement at this point in time are higher than expected, about the same as expected, or lower than expected? (if retiree)

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Level of Spending in Retirement

The majority of retirees generally find at the end of the year that they have spent about what they can afford. Nearly two in ten state they generally spend less than they can afford, while one in ten spend more than they can afford.

Figure 196: Level of Spending in Retirement
At the end of the year, do you generally find (and your spouse/partner) have spent more than you can afford, about what you can afford, or less than you can afford? (if retiree)

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Actions Taken to Decrease Spending

To decrease their spending, retirees most often try to spend less on purchases. Eating out less often, spending less on travel, and reducing gifts or charitable giving are also popular options.

Figure 207: Actions Taken to Decrease Spending
What actions did you take to decrease your spending? (Select all that apply.) (if retiree and made an effort to reduce spending)

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Difficulty in Reducing Spending

While nearly four in ten retirees who made an effort to reduce their spending report finding it at least somewhat difficult, half say it was not too difficult and 13 percent say it was not difficult at all

Figure 213: Difficulty in Reducing Spending

## Expected Future Change in Spending

Nearly six in ten pre-retirees expect their spending to decrease as they age in retirement. In contrast, the plurality of retirees say their spending will stay the same as they age. Just over onethird of retirees think it will decrease, while two in ten think it will increase.

Figure 219: Expected Future Change in Spending
As you age (in retirement), do you expect your spending to increase, stay the same, or decrease?

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Extent Needing to Preserve Assets Limits Spending

Pre-retirees are more likely than retirees to think that the need to preserve assets will cause them to limit their spending in retirement a great deal or somewhat. On the other hand, retirees are more apt than pre-retirees to indicate it limits their spending only a little or not at all.

Figure 226: Extent Need to Preserve Assets Limits Spending
To what extent, if at all, (do you think / does) the need to preserve assets in case they are needed for a possible future event (will) cause you (and your spouse/partner) to limit your spending (in retirement)?

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

Figure 227: Extent Need to Preserve Assets Limits Spending, by Household Income

## Maximum Amount Could Spend in Emergency

While two in ten pre-retirees and three in ten retirees report they could spend at least $\$ 25,000$ on something unexpected without jeopardizing their retirement security, for many the situation is quite different. Two in ten each say they could only afford to spend less than $\$ 1,000$ on such an emergency, and another one in ten each could spend $\$ 1,000$ to $\$ 4,999$ and $\$ 5,000$ to $\$ 9,999$. One-quarter of pre-retirees and two in ten retirees are not sure how much they could spend.

Figure 233: Maximum Amount Could Spend in Emergency
Suppose something unexpected were to happen to you (or your spouse/partner) that forced you to dip into your savings and investments to pay for it. What is the maximum amount you could afford to spend on the event, without jeopardizing your retirement security?

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## DEBT

Debt carried into retirement can jeopardize people's financial security in retirement. This section examines the types and amount of debt held by pre-retirees and retirees as well as its impact on their ability to save and maintain their retirement lifestyle and is a new area of focus for the study.

## Types of Debt

The most common types of debt held by pre-retirees and retirees are mortgages ( $52 \%$ of preretirees and $30 \%$ of retirees), credit card debt ( $48 \%$ and $35 \%$ ), and car loans ( $40 \%$ and $24 \%$ ). In general, pre-retirees are more likely than retirees to hold each type of debt.

Figure 240: Types of Debt
Do you (and your spouse/partner) currently have...?

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Age Mortgage Expected to be Paid Off

The typical pre-retiree with a mortgage reports that the mortgage on his/her primary home will be paid off by age 63 (median). However, those who carry a mortgage into retirement typically must wait until age 71 (median) before the mortgage is paid off. About two in ten each plan to sell the home before the mortgage is paid off, while 13 percent of pre-retirees and 28 percent of retirees say they are not sure when their mortgage will be paid off.

Figure 246: Age Mortgage Expected to be Paid Off
At what age do you expect to pay off the mortgage on your primary home? (if have a mortgage)

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Monthly Mortgage Payment

Six in ten retirees with a mortgage report their monthly mortgage payment is less than $\$ 1,000$. Pre-retirees tend to have higher payments, with just over half saying their mortgage payment is at least $\$ 1,000$ a month.

Figure 252: Monthly Mortgage Payment
Approximately how much is your current monthly mortgage payment? (Please exclude any escrow amounts for insurance and taxes.) (if have a mortgage)

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Amount of Debt (Excluding Mortgage)

Almost three in ten pre-retirees with debt report carrying at least $\$ 30,000$ in debt, excluding any mortgage. Another one in three carry between $\$ 10,000$ and $\$ 29,999$. Retirees tend to carry lower levels of debt, with half indicating their debt totals to less than $\$ 10,000$.

Figure 258: Amount of Debt (Excluding Mortgage)
(Not including your mortgage) approximately how much debt do (and your spouse/partner) have in total? (of those who have debt)

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Effect of Debt on Ability to Save

More than half of pre-retirees with debt state their debt has negatively impacted, ether a great deal or somewhat, how much they are able to put away each month in savings and investments. Less than one-quarter say their debt has not impacted their ability to save.

Figure 264: Effect of Debt on Ability to Save
To what extent, if at all, has debt negatively impacted how much you are able to put away each month in savings and investments? (if worker with debt)

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Effect of Debt on Ability to Maintain Lifestyle in Retirement

Generally, retirees with debt feel it has little, if any, impact on their ability to maintain their desired lifestyle. Just 15 percent report it has impacted their desired lifestyle a great deal.

Figure 269: Effect of Debt on Ability to Maintain Lifestyle
To what extent, if at all, has debt negatively impacted your ability to maintain your desired lifestyle? (if retiree with debt)

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## CAREGIVING AND FINANCIAL SUPPORT

Caregiving in retirement can be a source of stress, affecting both physical and financial health. More directly, the need to provide financial support to others can also drain financial resources. This new section looks at these two issues.

## Providing Care in Retirement

Retired widows are more likely than either retirees or pre-retirees to report they have spent time caring for others in retirement.

Figure 274: Providing Care in Retirement
(Do you think you will spend any time/Have you spent any time) caring (for someone other than your spouse/partner / for others) in retirement?

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

Figure 275: Providing Care in Retirement, by Household Income

## Type of Care Provided

Most frequently, pre-retirees and retirees expect to provide or have provided the following types of care: checking in regularly to see how the care recipient is doing ( $83 \%$ of pre-retirees and $70 \%$ of retirees), helping with household chores ( $82 \%$ and $59 \%$ ), providing transportation ( $80 \%$ and $70 \%$ ), and communicating with healthcare professionals on the recipient's behalf ( $65 \%$ and $56 \%)$.

Figure 280: Types of Care Provided
What types of unpaid care (do you expect to / have you) provide in retirement (for someone other than your spouse/partner)? (Select all that apply.) (if worker and expect to provide care or retiree and provided care in retirement)

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Financial Support to Others

Three in ten pre-retirees, but only about one in ten retirees, are currently providing financial support for someone other than themselves and their spouse/partner.

Figure 286: Financial Support to Others
Are you currently providing financial support for anyone other than yourself (and your spouse/partner)?

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## Recipients of Financial Support

Pre-retirees providing financial support most often do so to children under 21, while retirees most often provide this type of support to older children. More than one in ten provide financial support to parents or parents-in-law, and one-quarter of retirees support their grandchildren financially.

Figure 292: Recipients of Financial Support
To whom do you provide this support? (Click on all that apply.)

Differences by Population Subgroup
Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## THE PROCESS OF RETIRING

How and when Americans retire is critical to their welfare later in life. This section examines when people retire and their reasons for working longer than preferred.

As in previous iterations of this study, pre-retirees continue to say they will retire at a later age than retirees actually did retire.

## Expected/Actual Retirement

Although the typical retiree retires at age 60 (median actual retirement age), pre-retirees generally expect to retire at age 65 (median expected retirement age). Moreover, almost two in ten pre-retirees plan to work at least until age 68 and 14 percent indicate they do not expect to ever retire.

Figure 296: Expected/Actual Retirement
Expected/actual retirement age (from primary occupation)

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

Figure 301: Expected/Actual Retirement, by DB/DC Income

## Preferred Retirement Age

Both pre-retirees and retirees report they would prefer to retire at about age 62 (median). This means that while retirees retired earlier than they preferred, pre-retirees are planning to work beyond their preferred retirement age. For many, this is at least five years longer than they would like.

Figure 302: Preferred Retirement Age
At what age would you (prefer / have preferred) to retire from your primary occupation?

Figure 308: Preferred Retirement Age, by DB/DC Income

## Reasons for Working Longer than Preferred

Both pre-retirees and retirees typically postpone retirement for financial reasons, because they do not have enough money to retire, want to continue building their assets, or to keep employerprovided health benefits. However, pre-retirees are far more likely than retirees to select each of these reasons for working longer than preferred.

Figure 309: Major Reasons for Working Longer than Preferred
To what extent are each of the following major reasons why you (will wait longer than you would prefer/waited longer than you would have preferred) to retire? (if working longer than would like)

## Differences by Population Subgroup

Letters in superscript indicate meaningful differences between subgroups. For example, a number with the superscript " $a$ " indicates that number is meaningfully higher than the corresponding number in column (a). Comparisons are not made between pre-retiree subgroups and retiree subgroups.

## TRENDED CORE FINDINGS

A great deal of caution should be exercised when comparing the results of the 2015 and 2013 studies with the results from questions from earlier iterations of the survey. While the 2015 and 2013 studies were conducted online, all previous studies in the series were conducted by telephone. A test comparing online and telephone results for pre-retirees showed that telephone respondents were more likely than online respondents to choose responses at the extremes of attitudinal scales and to respond in what they may have perceived as more socially acceptable ways, such as providing later expected ages for retirement and indicating that they have a financial plan for retirement income and spending. In addition, telephone respondents are less likely than online respondents to select the "don't know" response. Therefore, many of the differences between the 2015 and 2013 findings and the findings from previous years may be the result of the change in survey mode rather than an indication of a true shift in attitudes or behavior of the pre-retiree and retiree populations.

Nevertheless, some conclusions about recurring themes and trends can be drawn, which are outlined below and illustrated in subsequent figures.

- Though the exact order may vary, long-term care, inflation, and health care continue to head the list of retirement risks that pre-retirees and retirees are concerned about, and preretirees remain more likely than retirees to say they are concerned about these risks.
- The three primary risk management strategies used by both pre-retirees and retirees remain reducing spending, elimination of debt, and saving as much as possible. Only a minority use insurance products other than health insurance to manage risks.
- The planning horizon for pre-retirees and retirees continues to be only about 10 years.
- Pre-retirees continue to say they will retire at a later age than retirees actually did retire.

These recurring themes do not change much, even though the environment has changed. During the time since the survey series started, there has been a continued shift to defined-contribution plans, the average age of the population has continued to increase, and there have been two periods of economic turmoil including a major decline in housing prices. The Affordable Care Act was also passed. These environmental changes have served to complicate the challenges that Americans face.

## Managing Risks in Retirement

Figure 315: Trended Issues of Concern, Among Pre-retirees
How concerned are you about each of the following (in retirement)?

|  | Very Concerned | Somewhat Concerned | Not Too Concerned | Not at All Concerned |
| :---: | :---: | :---: | :---: | :---: |
| You might not have enough money to pay for adequate health care |  |  |  |  |
| 2015 ( $\mathrm{n}=1,035$, online) | 26\% | 41 | 25 | 8 |
| 2013 ( $\mathrm{n}=1,000$, online) | 30\% | 43 | 20 | 7 |
| 2011 ( $\mathrm{n}=800$, telephone) | 43\% | 31 | 13 | 13 |
| 2009 ( $\mathrm{n}=403$, telephone) | 31\% | 36 | 14 | 19 |
| 2007 ( $\mathrm{n}=401$, telephone) | 35\% | 35 | 12 | 18 |
| 2005 ( $\mathrm{n}=300$, telephone) | 42\% | 32 | 13 | 12 |
| 2003 ( $\mathrm{n}=301$, telephone) (good health care) | 49\% | 30 | 8 | 13 |
| 2001 ( $\mathrm{n}=318$, telephone) (good health care) | 30\% | 28 | 19 | 23 |
| You might not have enough money to pay for a long stay in a nursing home or a long period of nursing care at home |  |  |  |  |
| 2015 ( $\mathrm{n}=1,035$, online) | 22\% | 47 | 23 | 9 |
| 2013 ( $\mathrm{n}=1,000$, online) | 27\% | 42 | 23 | 9 |
| 2011 ( $\mathrm{n}=800$, telephone) | 34\% | 32 | 19 | 15 |
| 2009 ( $\mathrm{n}=403$, telephone) | 22\% | 34 | 23 | 21 |
| 2007 ( $\mathrm{n}=401$, telephone) | 23\% | 41 | 17 | 20 |
| 2005 ( $\mathrm{n}=300$, telephone) | 35\% | 26 | 20 | 19 |
| 2003 ( $\mathrm{n}=301$, telephone) | 33\% | 32 | 16 | 18 |
| 2001 | (not asked) |  |  |  |
| You might deplete all of your savings |  |  |  |  |
| 2015 ( $\mathrm{n}=1,035$, online) | 21\% | 41 | 27 | 10 |
| 2013 ( $\mathrm{n}=1,000$, online) | 25\% | 41 | 26 | 9 |
| 2011 ( $\mathrm{n}=800$, telephone) | 33\% | 31 | 19 | 17 |
| 2009 ( $\mathrm{n}=403$, telephone) | 23\% | 35 | 20 | 21 |
| 2007 ( $\mathrm{n}=401$, telephone) | 18\% | 38 | 24 | 20 |
| 2005 ( $\mathrm{n}=300$, telephone) (and be left only with SS) | 28\% | 27 | 25 | 20 |
| 2003 ( $\mathrm{n}=301$, telephone) (and be left only with SS) | 37\% | 29 | 18 | 16 |
| 2001 | (not asked) |  |  |  |

| [IF WORKER:] Now.. | . 15 | -- | -- |
| You (prefer/preferred) to work your entire life and never retire $\qquad$ |  | 4 | 8 |
| Not applicable ................................................. | .... 3 | 10 | 10 |

13. [new] [IF WORK LONGER THAN WOULD LIKE:] To what extent are each of the following reasons why you (IF WORKER: will wait longer than you would prefer/IF RETIREE: waited longer than you would have preferred) to retire? [RANDOMIZE LIST.] (page 189)

| Pre-Retirees (n=406), Retirees (n=173), Retired Widows <br> $(\mathbf{n}=46)$ | Major <br> Reason | Minor <br> Reason | Not a <br> Reason |
| :--- | :---: | :---: | :---: |
| You (will/did) not have enough money to retire |  |  |  |
| Pre-Retirees | $71 \%$ | 17 | 12 |
| Retirees | $37 \%$ | 24 | 38 |
| Retired Widows | $39 \%$ | 22 | 39 |

b. You (will want/wanted) to continue building up your assets to ensure your financial security in retirement

| Pre-Retirees | $69 \%$ | 25 | 5 |
| ---: | :---: | :---: | :---: |
| Retirees | $51 \%$ | 23 | 26 |

c. You (will want/wanted) the health benefits provided by your employer

| Pre-Retirees | $50 \%$ | 24 | 26 |
| ---: | :--- | :--- | :--- |
| Retirees | $34 \%$ | 24 | 42 |
| Retired Widows | $41 \%$ | 17 | 41 |

d. [IF RETIREE:] You received an unexpected job opportunity

| Pre-Retirees | -- | -- | -- |
| ---: | :---: | :---: | :---: |
| Retirees | $3 \%$ | 9 | 87 |
| Retired Widows | $4 \%$ | 7 | 89 |

e. [IF RETIREE:] You found yourself unexpectedly reluctant to retire

| Pre-Retirees | -- | -- | -- |
| ---: | :---: | :---: | :---: |
| Retirees | $10 \%$ | 19 | 71 |
| Retired Widows | $15 \%$ | 13 | 72 |

[IF DO NOT CONSIDER THEMSELVES RETIRED OR WILL NEVER RETIRE, SHOW:] Many of the questions in this survey will ask about your retirement. Since you've said that (IF DOES NOT CONSIDER THEMSELVES RETIRED: you do not consider yourself retired/IF WILL NEVER RETIRE: you will never retire) please think about the period from age 65 on whenever retirement is mentioned.

## $\underline{\text { Shocks in Retirement }}$

## [IF RETIREE CONTINUE. WORKERS SKIP TO Q21.]

14. [new] Have you (or your spouse/partner) experienced any of the following during retirement? [RANDOMIZE] (page 63)

Pre-Retirees ( $\mathrm{n}=\mathbf{0}$ ), Retirees ( $\mathrm{n}=\mathbf{1 , 0 0 5 \text { ), Retired Widows ( } \mathrm { n } = 2 8 2 \text { ) Yes No }}$
a. An illness or disability that limited your (IF

MARRIED/PARTNER/RETIRED WIDOW: or your spouse's/partner's)
ability to care for (yourself/yourselves)

| Pre-Retirees | -- | -- |
| ---: | :---: | :---: |
| Retirees | $15 \%$ | 85 |
| Retired Widows | $22 \%$ | 78 |

b. Significant out-of-pocket medical or prescription expenses from a chronic health condition or disability that did not limit your (IF
MARRIED/PARTNER/RETIRED WIDOW: or your spouse's/partner's)
ability to care for (yourself/yourselves)

| Pre-Retirees | -- | -- |
| ---: | :---: | :---: |
| Retirees | $20 \%$ | 80 |
| Retired Widows | $12 \%$ | 88 |

c. Major dental expenses
Pre-Retirees -- --

Retirees $24 \% \quad 76$
Retired Widows 28\% 72
d. Loss of capacity requiring someone outside the household to manage your money

| Pre-Retirees | -- | -- |
| ---: | :---: | :---: |
| Retirees | $1 \%$ | 99 |
| tired Widows | $1 \%$ | 99 |

e. The death of a spouse or long-term partner during retirement

| Pre-Retirees | -- | -- |
| ---: | :---: | :---: |
| Retirees | $10 \%$ | 90 |
| Retired Widows | $56 \%$ | 44 |

f. Divorce during retirement

| Pre-Retirees | -- | -- |
| ---: | :---: | :---: |
| Retirees | $3 \%$ | 97 |
| Retired Widows | $1 \%$ | 99 |

15. [new] And have you (or your spouse/partner) experienced any of the following during retirement? [RANDOMIZE] (page 63)

a. A loss in the total value of your savings of $10 \%$ or more due to poor investment decisions or a bad investment

| Pre-Retirees | -- | -- |
| ---: | :---: | :---: |
| Retirees | $9 \%$ | 91 |
| Retired Widows | $8 \%$ | 92 |
