**Alice**

Hello  
Alice!

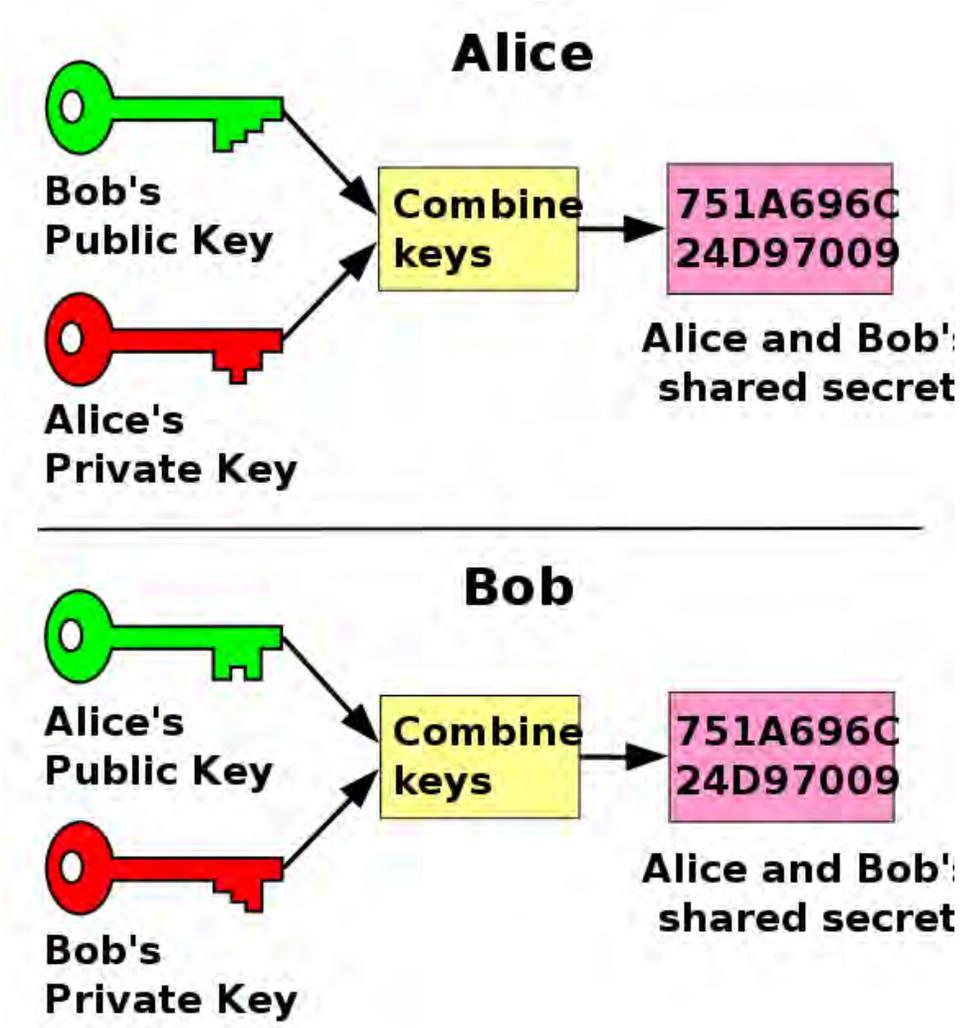

Decrypt

Alice's  
private key

# Public Key Cryptography

Two-way encryption

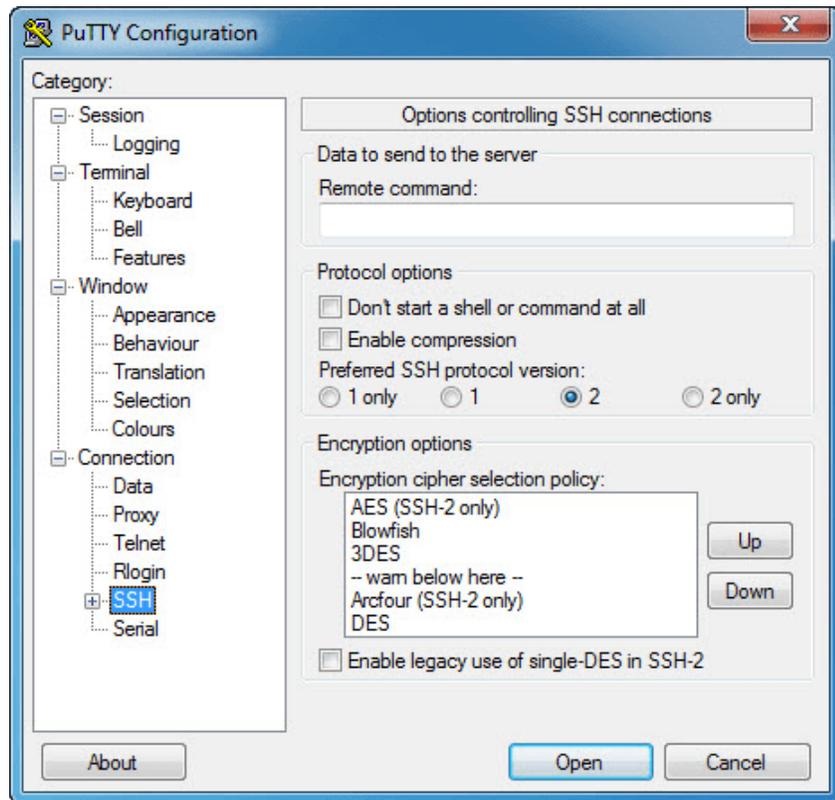

# SSH Clients

Built-in to Mac OSX and Linux,  
Have to install client on Windows...

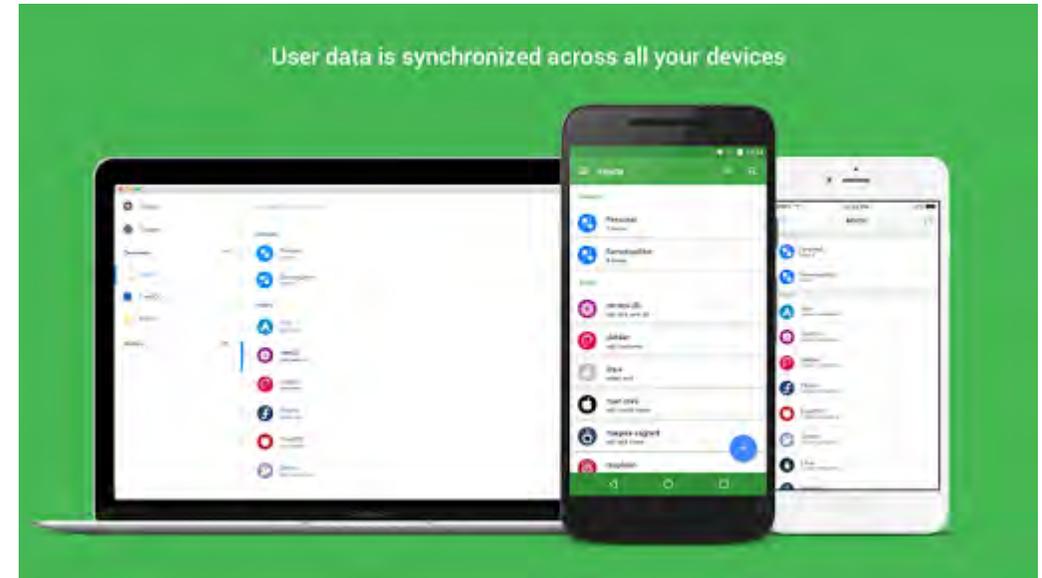

Putty (<https://www.putty.org/> )

- Free, tried and true

Termius (<http://www.termius.com/>)

- Paid, cross-platform, cloud sync

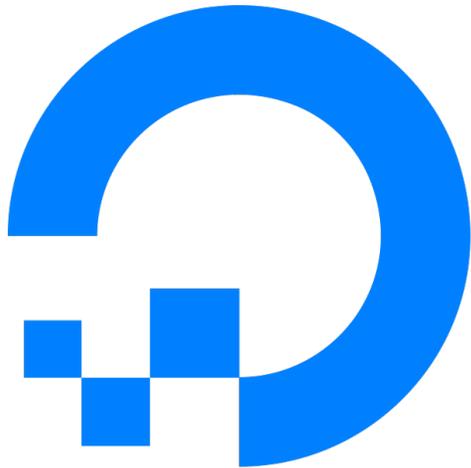

... and countless more options available.

# Big Cloud Providers

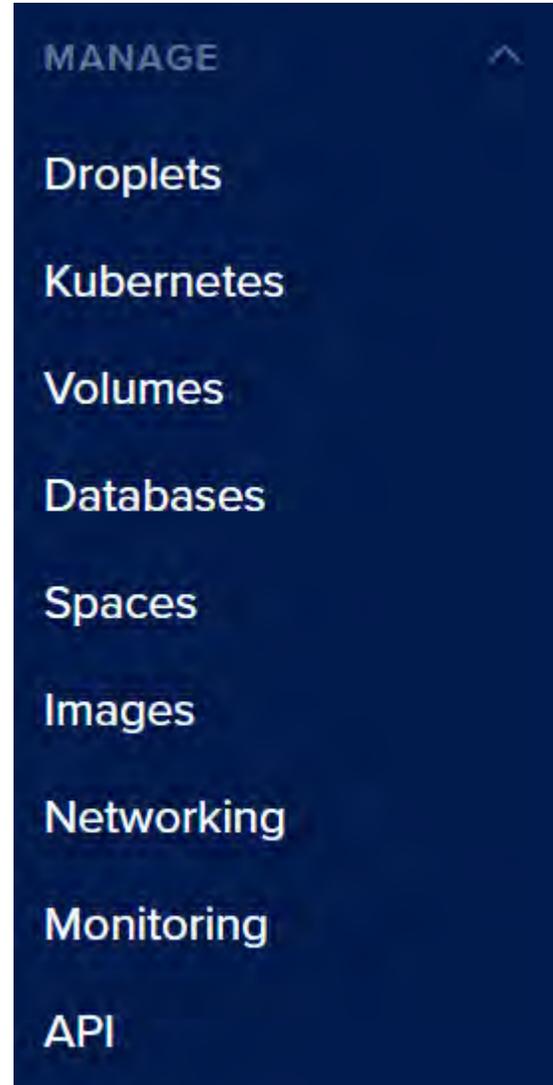

# Bite-Sized Cloud Provider

<https://www.digitalocean.com/>

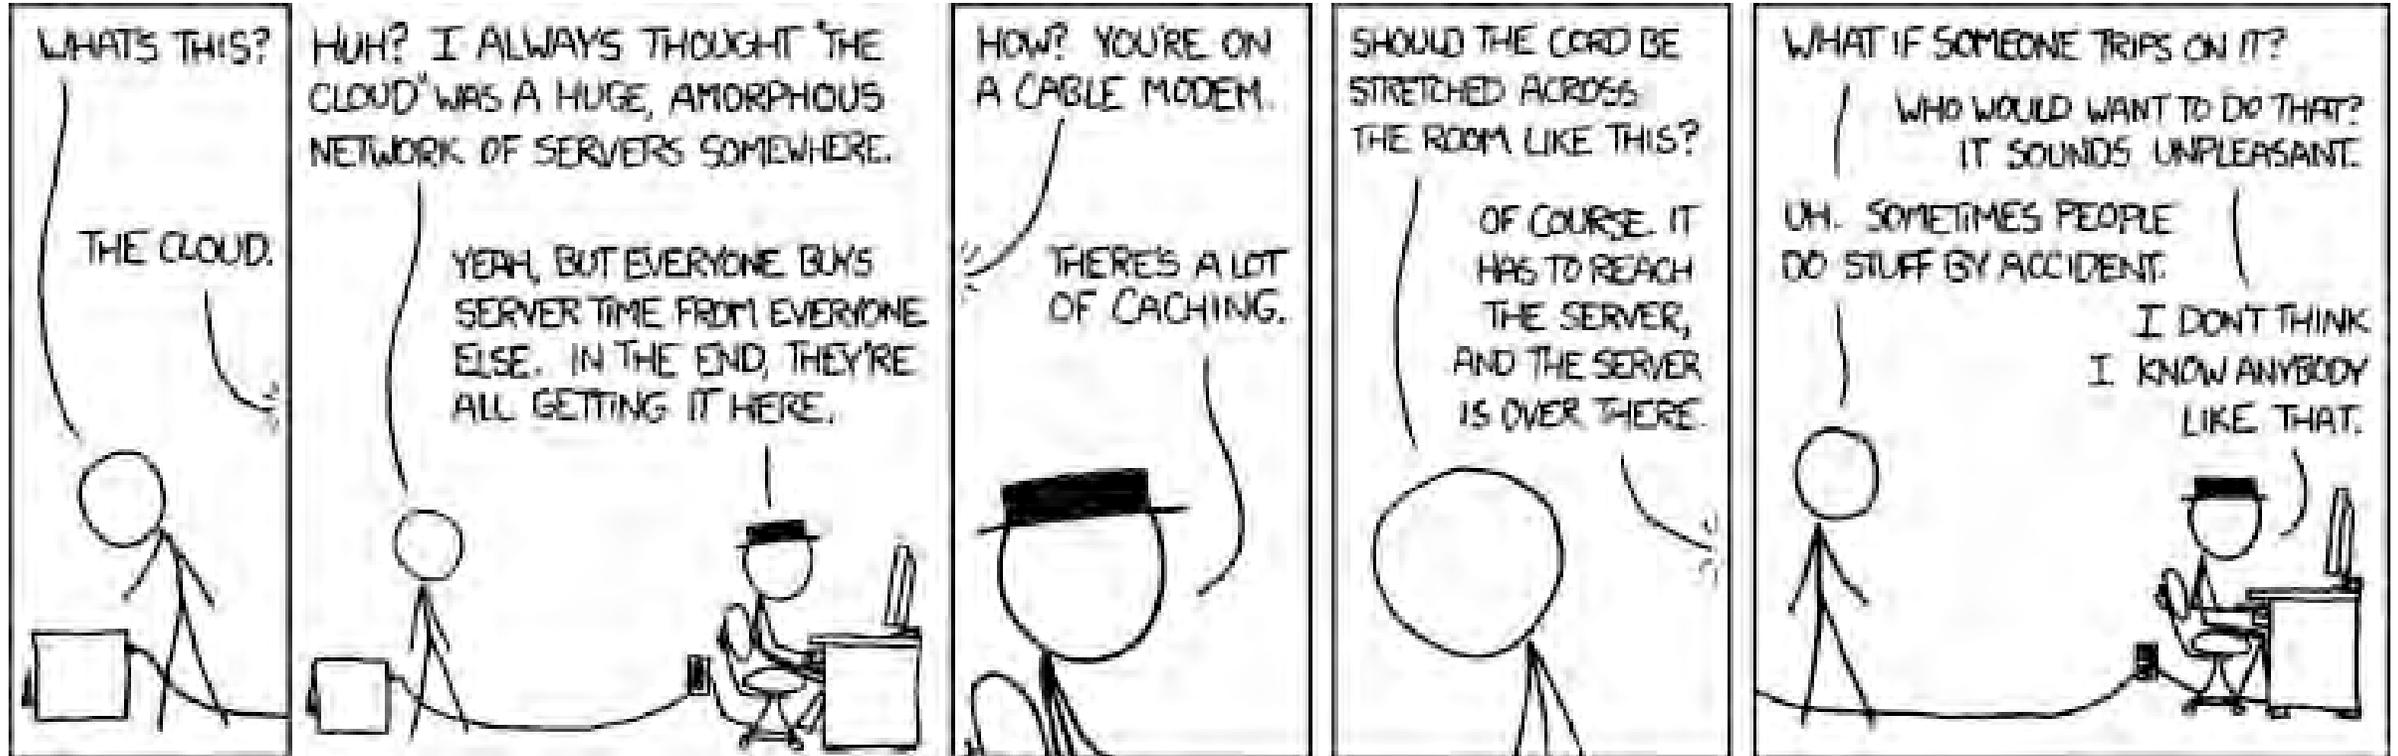

# DigitalOcean

# The steps

- Make an SSH key with Termius
- Upload public key to Digital Ocean account
- Launch private Virtual Machine (VM) on Digital Ocean
  - Use a container-centric OS (e.g. CoreOS)
  - Digital Ocean injects our public key into this VM when it is created
- Add firewall rule to only allow SSH
- Use Termius to connect to our VM
  - If using CoreOS, username is “core”
  - VM will send us its own public ~key at this time.
- Launch data science container: <https://github.com/jupyter/docker-stacks>
  - `docker run -d -p 8888:8888 jupyter/scipy-notebook`
- Get URL w/ access token for Jupyter notebook (`docker logs -f ...`)
- Use Termius to securely forward port 8888 from VM to local PC
- Use local web browser to access Jupyter notebook with provided URL
- Use Jupyter notebook interface to:
  - Upload data, Run analysis, Download results
- Destroy VM

# Obligatory xkcd: <https://xkcd.com/908/>

# Cautions and Caveats

- You should always involve your local IT department.
- Cloud vendors impose limits until they trust you.
- You really don't want to run the same VM for weeks at a time.
  - You become responsible for security updates and a whole mess of other things.
  - You also would get charged for a lot of idle time...
- You should learn about cloud-native data storage soon after trying this.
  - And you need to be mindful of data transfer charges.
- You likely want to get away from managing VMs at all.
  - Which is a large reason the big cloud vendors are so complex.
  - You should also look at custom Data Science cloud “wrappers” (e.g. DataBricks, Data Robot)
- Refine cloud firewall to only allow specific IPs.
- Don't store ePHI / PII without entering proper agreements.
  - Digital Ocean won't enter BAAs yet even...
- Be careful when choosing which cloud data center to ensure compliance with data sovereignty

# Thank you

**Shea Parkes**

# Other container examples

- `docker run -d -p 8888:8889 -e JUPYTER_ENABLE_LAB=yes jupyter/scipy-notebook`
  - Still need to open logs to find URL with access token.
  - The above maps to 8889 just to avoid conflict with basic Jupyter
- `docker run -d -p 8787:8787 -e PASSWORD=soa rocker/rstudio`
  - No token URL needed, just browse to <https://127.0.0.1:8787> (after forwarding port)
  - Username is “rstudio”, password is whatever you make it above.
