**1968 VOL. 20 PT. 1 NO. 58**

**HOSPITAL AND SURGICAL EXPENSE INSURANCE  
UNDER GROUP CONVERSIONS**

**SAMUEL E. SHAW II**

**ABSTRACT**

This paper records the results of a study, made under the sponsorship of the Society's Committee on Experience under Group Health Insurance, of the morbidity experience of individual policies arising from conversions of group accident and health insurance. The study was based on nonmaternity experience from several companies for calendar years 1963 and 1964 on policies with 31- and 70-day hospital daily room and board benefits, hospital ancillary services benefits, and surgical benefits. For each type of benefit, a series of three tables shows experience subdivided by sex or family status, by calendar duration, and by attained age group. The tables derive annual claim costs, incidence rates, and average claim amounts. The annual claim costs and incidence rates for each duration are compared to those for duration 3 and over, and the final table for each benefit compares incidence rates and annual claim costs for duration 3 and over with values for that benefit derived from the 1956 Intercompany Hospital or Surgical Tables.

---

**T**HIS paper records the results of a study, made under the sponsorship of the Society's Committee on Experience under Group Health Insurance, of the morbidity experience of individual policies arising from conversions of group accident and health insurance. The study was based on nonmaternity experience from several companies for calendar years 1963 and 1964 on policies with 31- and 70-day hospital daily room and board benefits, hospital ancillary services benefits, and surgical benefits. Because of the many other experience studies to which companies are asked to contribute, it is not planned to conduct an annual study of group conversion experience, and the Committee has graciously allowed the author to present the results of the first compilation in the form of this paper rather than as one of the annual reports. It is emphasized that the information presented here should be interpreted cautiously with respect to the level of future costs, primarily because of the time that has passed since the period of the study and the limited amounts of data in some subdivisions of the experience.

The results of the study represent a composite of the experience resulting from variations in policy forms and underlying administration and claim procedures. The following companies contributed experience for the study: Aetna Life Insurance Company, Connecticut General Life Insurance Company, Equitable Life Assurance Society (1963 only), John Hancock Mutual Life Insurance Company (1964 only), Metropolitan Life Insurance Company, New York Life Insurance Company, and Prudential Insurance Company of America. A copy of the instructions used to prepare contributions for the study may be obtained by writing the author.

The tables in this report show data subdivided by duration as measured in number of calendar years since the year of conversion. Not all the companies, however, contributed experience for duration 0, the calendar year of issue of the converted policy.

#### ANALYSIS OF EXPERIENCE

For each type of benefit, a series of three tables has been prepared. The first table shows experience subdivided by sex, calendar duration, and attained age group, and the second table is subdivided by family status (defined according to whether the conversion policy has been applied for individually or as a member of a family), sex, and calendar duration. Each of these tables derives annual claim costs, incidence rates, and average claim amounts. Individual experience and family experience were combined in the various tables by sex, calendar duration, and age, but separate results are shown by sex and calendar duration which give the relationship of the experience on persons insured under individual as opposed to family policies. Where ratios to duration 3 and over experience are shown in the second table for each benefit, the comparisons are made with the values by sex and age for duration 3 and over shown in the preceding table. Claim costs, incidence rates, average claims, and average hospital durations or average maximum benefits exposed are included for information in the total lines. Comparisons between these figures could be misleading, however, because the totals contain different distributions of experience by age and duration.

The final table for each benefit compares incidence rates and annual claim costs for duration 3 and over with values for that benefit derived from the 1956 Intercompany Hospital or Surgical Tables (*TSA*, IX, 334 ff.).

#### HOSPITAL ROOM AND BOARD BENEFIT

For hospital room and board benefits, Tables 1, 2, and 3 show experience for 31-day plans and Tables 4, 5, and 6 for 70-day plans. The claim cost per \$1 of daily benefit is usually defined as equal to the product of

frequency and average duration, both derived in relation to the amount of daily benefit in force on exposures and claims. However, in these tables neither the incidence rate (the quotient of number of claims divided by number of lives exposed) nor the average hospital duration (the quotient of the total number of days of hospital confinement for claims divided by the number of claims) has been weighted by the amount of daily benefit in force on exposures and claims. Therefore, the product of these two items, although close to the claim cost, does not equal the claim cost. The claim cost (the quotient of benefits incurred divided by daily benefits exposed) does take into account the weighted amounts of daily hospital benefit.

Ratios to duration 3 and over which have been normalized by sex and age in Tables 2 and 5 show that costs are higher in duration 0 relative to the other durations and higher for persons insured under individual as opposed to family policies. Among ages, Tables 4 and 6 show male claim costs for age groups closely preceding age 65 which are sharply higher than claim costs for the earlier attained ages. This may result from a relatively large number of employees who retire early because of poor health and who elect to convert.

#### HOSPITAL ANCILLARY SERVICES BENEFIT

Tables 7, 8, and 9 present experience on hospital ancillary services benefits, including outpatient as well as inpatient claims. For convenience, claim costs are expressed per \$100 unit of whatever average maximum ancillary services benefit is exposed on each line.

The average maximum benefit exposed per life varies widely within the experience contributed, grading from about \$200 per life at the youngest ages in the most recently issued experience to less than \$80 per life at the oldest ages for duration 3 and over. Other studies show that the ratio of the average claim to the maximum benefit exposed decreases as the maximum benefit increases. To allow for this, the ratios shown in the fifth column of Tables 7 and 8 are based on claim costs in duration 3 and over which have been adjusted to reflect differences in the average maximum benefit exposed, among the various subdivisions of the experience. These adjusted claim costs in duration 3 and over for each sex and age group were obtained by multiplying the unadjusted claim cost by the quotient of two average claims derived from 1956 Intercompany Hospital Table and expressed per \$100 unit of maximum benefit. These average claims from the 1956 Table correspond to the average maximum benefit exposed in the duration being compared with duration 3 and over and to the average maximum benefit exposed in duration 3 and over.

After these adjustments have been made, Table 8 shows high costs in duration 0 relative to the other durations and for persons insured under individual as opposed to family policies. Table 9 indicates that high incidence rates seem to contribute to the poor experience, relative to the 1956 basis, to a greater extent in the case of ancillary benefits than for either room and board or surgical benefits. It should be kept in mind, however, that Table 9 compares experience which includes outpatient claims (about four-fifths of the exposure in this study provides outpatient benefits) with the 1956 Intercompany Hospital Table, which was based on inpatient benefits only.

#### SURGICAL BENEFIT

Tables 10, 11, and 12 show surgical experience in terms of the "Standard Schedule" (defined in *TSA, 1952 Reports*, 47-50) and the 1956 Intercompany Surgical Table. A small amount of surgical experience on
