## **1975 REPORTS OF MORTALITY AND MORBIDITY EXPERIENCE**

---

### **REPORTS OF THE COMMITTEE ON ORDINARY INSURANCE AND ANNUITIES**

#### **I. MORTALITY UNDER STANDARD ORDINARY INSURANCE ISSUES BETWEEN 1973 AND 1974 ANNIVERSARIES**

##### **ABSTRACT**

This is the latest in a series of annual reports on intercompany mortality experience under Standard Ordinary life insurance policies. Each of the tables included in this report shows amount exposed to risk, actual death claim amounts, expected death claim amounts, and mortality ratios of actual to expected deaths. The expected death claims are based on the 1965-70 Basic Tables. All other data are based on the contributions of nineteen large life insurance companies. The tables are based on either select (first fifteen policy years) or ultimate experience.

The following results, which exclude the effect of war deaths, summarize the important conclusions reached in this study.

##### *General Mortality*

The overall medical mortality ratio in the select period declined by 4.9 percentage points from last year's study.

The overall nonmedical mortality ratio in the select period declined by 3.1 percentage points from last year's study.

The overall mortality ratio in the ultimate period declined by 0.4 percentage points from last year's study.

On the basis of very limited data, experience on paramedical issues was actually somewhat better than the experience on medical issues.

##### *Medical versus Nonmedical Mortality*

In the select period, for all durations combined, nonmedical mortality continued to be higher than medical mortality at issue ages 20-44.

In the ultimate period, for all attained ages, nonmedical mortality exceeded medical mortality.

For males, nonmedical mortality in the select period for all durations combined exceeds medical mortality for issue ages 10-44.

For females, nonmedical mortality in the select period for all durations combined exceeds medical mortality for issue ages 1-9 and 35-49.

*Premium-paying versus Paid-up Mortality—Ultimate Period*

Overall, mortality on premium-paying insurance continues to exceed that on paid-up by about 5 percentage points. However, for attained ages 15-19 and 30-59, the mortality ratios are higher for paid-up.

*Male versus Female Mortality*

There was little change from last year's study, with female mortality averaging about 60 per cent of male mortality.

## INDEX OF TABLES

Table	Exposure Period	Policy Years	Medical or Nonmedical	Male and Female	Mortality Ratios by
1.....	1973-74	1-15	Medical	Combined	Ages at issue

## INTRODUCTION

**T**HIS report covers the intercompany mortality experience under Standard Ordinary insurance issues between 1973 and 1974 anniversaries, and also for the period between 1969 and 1974 anniversaries where one year's exposure provided an insufficient volume of data. It reviews in turn the mortality experience under the following:

1. Standard Ordinary insurance issued subject to a medical examination, observed during each of the first fifteen policy years;
2. Standard Ordinary insurance issued without a medical examination, observed during each of the first fifteen policy years; and
3. Standard Ordinary insurance observed during the sixteenth and subsequent policy years. As in previous reports, this ultimate experience is shown for medical and nonmedical issues combined, with a portion of it shown for medical and nonmedical issues separately. A table comparing the ultimate experience under premium-paying and fully paid-up (excluding reduced paid-up) policies has also been included.

A summary of aggregate mortality ratios based on the 1965-70 Basic Tables for each major category of experience is as follows:

	EXPERIENCE BETWEEN ANNIVERSARIES			
	Excluding War Deaths		Including War Deaths	
	1972-73	1973-74	1972-73	1973-74
Medical select.....	92.8%	89.9%	92.9%	88.0%
Nonmedical select.....	102.2	99.1	102.6	99.1
Ultimate.....	93.8	93.4	93.8	93.4

The tabulation at the top of page 4 shows war deaths (see definition in Appendix II) by amount and the ratio of war deaths to total deaths experienced between 1969 and 1974 anniversaries.

Because of the declining proportion of total deaths represented by war deaths and their minor effect on the mortality ratios, it is felt that the impact of war deaths can for all practical purposes be ignored. For consistency with prior studies all tables (except for the detailed tables in Appendix I) exclude the effect of war deaths.

The names of the nineteen contributing companies and their proportionate contributions to the total exposure are given in Table A of Appendix I.

§ Less than 0.05 per cent.

**EXPERIENCE UNDER STANDARD ISSUES DURING THE  
FIRST FIFTEEN YEARS OF INSURANCE**

*Medically Examined Issues*

The current experience during the first fifteen policy years is based on an exposure of \$140 billion and actual claims of \$426 million. This represents an increase in the exposure from the preceding year of 1.9 per cent.

The 1965-70 Male, Female, and Male and Female Combined Select Basic Tables (*TS.1, 1973 Reports*, p. 199, and *1974 Reports*, p. 57) were used to calculate expected deaths separately for the male experience, female experience, and experience reported without subdivision by sex. The expected deaths for these three classes of experience were combined, and mortality ratios were calculated excluding war deaths.

The results by age group at issue are shown in Table 1 for the first fifteen policy years combined. The experience by year of issue is presented in Table 2. The detailed experience by age group at issue for each year of issue is set forth in Table B of Appendix I. Since this is the first study published using the 1965-70 Basic Tables, the last column in both Tables 1 and 2 shows the corresponding ratios from last year's study (i.e., experience between 1972 and 1973 anniversaries).

The aggregate mortality ratio, excluding war deaths, for the period

from 1973 to 1974 anniversaries was 87.9 per cent. The following tabulation shows how this result compares with the previous study based on the 1965-70 Basic Tables.

Exposure Year	Aggregate Mortality Ratio
1972-73.....	92.8%
1973-74.....	87.9

As seen in Table 1, there were two issue-age groups which showed mortality ratios greater than 100.0 per cent for 1973-74 anniversaries ages 15-19 and ages 25-29.

As seen in Table 2, mortality ratios by year of issue ranged from 79.0 per cent for 1965 (policy year 9) to 106.3 per cent for 1963 (policy year 11).

\* Excludes war deaths.

† Covers issues of 1958-72.

*Nonmedical Issues*

The current experience during the first fifteen policy years is based on an exposure of \$108 billion and actual claims of \$110 million. This represents an increase in the exposure from the preceding year of 7.2 per cent.

Expected deaths were calculated on the 1965-70 Select Basic Tables in the same manner as for medically examined issues. These tables were based on experience under medical issues.

For all age groups combined, nonmedical business now comprises 43.5 per cent of the total experience on recent Ordinary issues, measured by the exposures during the first fifteen policy years, as compared with 42.2 per cent last year. For all age groups combined, the proportion of non-medical issues in the first policy year for 1973-74 was 50.9 per cent, compared with 48.8 per cent in last year's report. The following tabulation shows nonmedical exposures as a percentage of total medical and non-medical exposures, by age group at issue, for experience between 1973 and 1974 anniversaries.

**NONMEDICAL EXPOSURES AS PERCENTAGE  
OF TOTAL EXPOSURES**

Ages at Issue	Policy Year 1	Policy Years 1-15
0-9.....	94.3%	88.3%
10-19.....	94.0	88.1
20-29.....	75.3	68.8
30-39.....	27.0	24.0
40-49.....	4.5	3.4
50 and over.....	0.4	0.2
All ages.....	50.9%	43.5%

The mortality ratios for nonmedical issues are presented in Table 3 by age group at issue for the first fifteen policy years combined. The aggregate mortality ratio, excluding war deaths, for the period from 1973 to 1974 anniversaries was 99.1 per cent. The following tabulation shows how this result compares with the previous study based on the 1965-70 Basic Tables.

Exposure Year	Aggregate Mortality Ratio
1972-73.....	102.2%
1973-74.....	99.1

The last column of Table 3 shows the corresponding ratios from last year's study (i.e., experience between 1972 and 1973 anniversaries).

The mortality ratios in Table 3 understate somewhat the death rates

for nonmedical business because, in calculating the expected deaths, no adjustment was made for the fact that the average ages of the exposures under nonmedical issues for issue-age groups 35-39, 40-44, 45-49, and 50 and over are lower than the average ages of the exposures for these age groups in the medical experience entering into the 1965-70 Basic

All ages	\$107,850,754	\$110,489	\$111,532	99.1%	102.2%

\* Excludes war deaths.

† Exposures not adjusted for distribution by age within each five-year age group at issue.

‡ Covers issues of 1958-72.

Tables. This situation arises because the maximum age at which nonmedical business is issued by the various contributing companies falls at 35, 40, 45, or 50. Thus the nonmedical exposures beyond these ages tend to fall off sharply. It is likely that a further understatement arises from the general practice of reducing nonmedical amount limits in steps of \$5,000 or \$10,000 beyond ages such as 35 and 40.

An indication of the extent to which Table 3 understates the true mortality on nonmedical business is given in the following tabulation, which

shows mortality ratios adjusted for the distribution of exposures by age within each five-year age group at issue. Only the nonmedical age limits of the contributing companies were considered in making this adjustment; the reductions in amount limits mentioned above were not considered.

**MORTALITY RATIOS ON NONMEDICAL ISSUES  
OF 1959-73  
EXPERIENCE BETWEEN 1973 AND 1974 ANNIVERSARIES  
BY AGE AT ISSUE  
POLICY YEARS 1-15 COMBINED**

(Expected Deaths on 1965-70 Select Basic Tables)

AGES AT ISSUE	MORTALITY RATIOS	
	Unadjusted	Adjusted
35-39.....	105.3%	105.3%
40-44.....	104.3	115.4
45-49.....	77.3	84.8
50 and over.....	64.8	65.7
Ages 35 and over.....	103.6%	106.3%

The unadjusted mortality ratios understate the true mortality on non-medical business to a significant degree at ages 40-44. Except for one company, whose limit for nonmedical issues was age 50 until 1959, non-medical issues at ages 45-49 and especially at ages 50 and over are largely business issued under special circumstances (such as pension trust and salary allotment plans), which do not appreciably affect the distribution of exposures by age within each five-year age group at issue. So-called policyholder's nonmedical, issued on the basis of a previous medical examination within six or twelve months, is also included for some companies; others include it in their medical issues.

The nonmedical mortality ratios by year of issue for all ages at issue combined during the period from 1973 to 1974 anniversaries are presented in Table 4 on an unadjusted basis. The highest mortality ratio by year of issue was 110.0 per cent for issue year 1968 (policy year 6); the ratios for years of issue 1969-72 (policy years 2-5) were also greater than 100 per cent.

The details of the unadjusted experience by age groups at issue for each year of issue are set forth in Table C of Appendix I.

The tabulation at the top of page 10 indicates the variation in the aggregate mortality ratios of the contributing companies from the all-company average of 99.1 per cent.

	Number of Companies	Proportion of Actual Deaths

‡ Covers issues of 1958-1972.

*Comparison of Medical and Nonmedical Experience*

It would be desirable to compare the nonmedical experience with the experience on strictly comparable policies issued with a medical examination, but data for such a comparison are not available.<sup>1</sup> Table 5 presents side by side the experience on medical and nonmedical issues as reported to the Committee for the five-year period from 1969 to 1974 anniversaries. The 1965-70 Male, Female, and Male and Female Combined Select Basic Tables, respectively, were used to calculate expected deaths for the male experience, female experience, and experience reported without subdivision by sex.

The nonmedical mortality ratios shown in Table 5 have been adjusted to reflect the approximate distribution of nonmedical exposures by age for issue-age groups 35-39 and higher. The lower half of Table 5 shows that, for policy years 1-15 combined, nonmedical mortality exceeds medical mortality appreciably at issue ages 20-44; the excess ranges from about 5 per cent at issue ages 25-29 to about 25 per cent at issue ages 40-44.

*Paramedically Examined Issues*

Companies were asked to submit their data on paramedically examined business separately. Seventeen companies were able to comply. The total exposure submitted was \$6 billion, which is less than 5 per cent of the medically examined experience. Of the \$6 billion, about 92 per cent of the total exposed is concentrated in the first two policy years. The mortality ratios for the first two policy years, along with the corresponding ratios for medical and nonmedical business, are as follows:

POLICY YEAR	MORTALITY RATIOS FOR BUSINESS EXAMINED		
	Para-medically	Medically	Non-medically
1.....	81.5%	88.2%	91.8%
2.....	90.0	99.3	102.3
1-2.....	81.1%	94.2%	96.1%

<sup>1</sup> Four factors, among others, which should be considered in the comparisons presented in this study are the following: (a) the relative proportions of medical and nonmedical business differ among companies (see Appendix I, Table A); (b) the underwriting standards of the contributing companies differ; (c) the age distributions of the various types of business differ; and (d) the proportions of business applied for non-medically but issued subject to medical examination and then classified as medical business differ among companies.

Care should be taken in interpreting the data for paramedically examined business, since the exposure in these two policy years is only about 17 per cent of the corresponding figures for either medical or nonmedical business.

EXPERIENCE UNDER STANDARD ISSUES DURING THE  
SIXTEENTH AND SUBSEQUENT POLICY YEARS

The current experience during the sixteenth and subsequent policy years is based on an exposure of \$71 billion and actual claims of \$1,072 million, excluding war deaths. This represents an increase in the exposures from the preceding year of 7.2 per cent. Mortality ratios are presented in Table 6 by attained-age groups based on (1) the 1965-70 Ultimate Basic Tables (Male, Female, and Male and Female Combined, respectively, for the male experience, female experience, and experience reported without subdivision by sex); (2) the Commissioners 1941 Standard Ordinary Mortality Table; and (3) the Commissioners 1958 Standard Ordinary Mortality Table. The aggregate mortality ratio, excluding war deaths,

on the 1965–70 Ultimate Basic Tables for the period from 1973 to 1974 anniversaries was 93.4 per cent. The sixth column of Table 6 shows the corresponding ratios from last year's study (i.e., experience between 1972 and 1973 anniversaries).

The following tabulation shows how this result compares with the previous study based on the 1965–70 Basic Tables.

Exposure Year	Aggregate Mortality Ratio
1972–73.....	93.8%
1973–74.....	93.4

The tabulation that follows indicates the variation in the aggregate mortality ratios of the contributing companies from the all-company average of 93.4 per cent.

	Number of Companies	Proportion of Actual Deaths
<b>Percentage points below average:</b>		
10–20.....	4	5.5%
5–10.....	2	17.0
0–5.....	6	25.2
<b>Percentage points above average:</b>		
0–5.....	4	26.2
5–10.....	2	21.7
10–20.....	1	4.4

#### *Comparison of Medical and Nonmedical Experience*

Companies were asked to subdivide their ultimate data into medical and nonmedical if they could conveniently do so. Twelve companies were able to subdivide their data in this manner. The results of this experience between 1969 and 1974 anniversaries are shown in Table 7. These data involve exposures which comprise 45.6 per cent of the entire ultimate experience reported for the period, as compared with 44.6 per cent for the previous study.

For all attained-age groups the nonmedical mortality is higher than the medical.

#### *Comparison of Premium-paying and Fully Paid-up Experience*

A comparison of the mortality on premium-paying and fully paid-up (excluding reduced paid-up) policies for the period from 1969 to 1974 anniversaries is shown in Table 8 for standard medical and nonmedical issues combined. Fifteen companies submitted their experience separately on premium-paying policies, and thirteen companies did so on fully paid-

up policies. On the basis of the experience between 1969 and 1974 anniversaries, data identified as premium-paying constituted 76.3 per cent and data identified as fully paid-up constituted 14.4 per cent of the total ultimate experience of all companies.

Mortality ratios are consistently higher on premium-paying than on fully paid-up policies at the higher attained ages.

#### EXPERIENCE BY SEX

All of the nineteen contributing companies submitted all or the major portion of both their medical and their nonmedical select data separately for males and females.

Tables 9-12 examine the experience by sex between 1969 and 1974 anniversaries for the select and ultimate data.

The mortality ratios by age group at issue and sex for the first fifteen policy years combined, covering the experience from 1969 to 1974 anniversaries, are presented in Table 9 for standard medically examined issues and in Table 10 for standard nonmedical issues. For the purpose of comparing male and female mortality, the right-hand columns of these tables are based on mortality ratios for females with expected deaths calculated on the male table. The highest ratios of female to male mortality are found at issue ages 0, 20-39, and 70 and over for medical issues and at

\* Excludes war deaths.

† Female mortality ratios calculated on 1965-70 Male Select Basic Table.

issue ages 0 and 25–39 for nonmedical issues. The ratios of female to male mortality are generally lower on nonmedical than on medical business at issue ages 10 and over, while at the lower ages the opposite is true.

Table 11 presents side by side the experience for the five-year period from 1969 to 1974 anniversaries on medical and nonmedical issues, separately for each sex, for policy years 1–2, 3–5, 6–10, 11–15, and 1–15. The nonmedical mortality ratios shown in Table 11 have been adjusted approximately to reflect the distribution of nonmedical exposures by age for issue-age groups 35–39 and over. For males the ratios of nonmedical to medical mortality tend to increase with issue age and are in excess of 100 per cent at issue ages 10–44 in policy years 1–15 combined. For females the ratios exceed 100 per cent for issue ages 1–9 and 35–49 in policy years 1–15 combined.

\* Excludes war deaths.

† Exposures adjusted for distribution by age within each five-year age group.

The mortality ratios by attained-age groups and sex for policy years 16 and over combined, covering the experience from 1969 to 1974 anniversaries, are presented in Table 12 for standard medical and nonmedical issues combined. Again, for the purpose of comparing male and female mortality, the right-hand column of this table is based on mortality ratios for females with expected deaths calculated on the male table. Twelve of the contributing companies submitted data separately for males and females for policy years 16 and over. The highest ratios of female to male mortality are found at attained ages 35-54 and 80-95.

NOTE.—A Comparative Mortality Study of the select experience between 1969 and 1974 anniversaries for the above companies is available upon request to the Office of the Society of Actuaries. The companies are not identified by name but are differentiated simply by a system of code letters. Experience is shown by issue-age groups and by issue year separately for medical and nonmedical business.

## APPENDIX II

## DEFINITION OF "WAR DEATHS"

War deaths are identified by the 1970 Committee Code 99. In coding for war deaths, some companies may refer to the Report of Casualty form furnished by the various armed forces. Item 2 of this form has two boxes to indicate whether death arose in "battle" or "non-battle." In addition to all "battle" deaths, it should be noted that many (but not all) "non-battle" deaths should be coded 99. For example, a death arising after battle but due to burns received in battle may be coded by the government as a "non-battle" death. In cases like this, a review of the comments given in item 2 is necessary to determine the full facts and whether death was due to the operations of war and hence should be coded 99.

Questions may arise with regard to the coding of military service deaths outside the combat area which may nevertheless be attributable to the Vietnam operation. For example, a plane on the way to Vietnam may crash far outside the Vietnam area, or a death in Japan may be the result of activity for the benefit of the Vietnam engagement. Such details should be treated as due to the operations of war and coded 99.

Military service deaths which cannot be tied in with the Vietnam engagement should not be treated as due to operations of war. For example, the Committee's code 89 would apply to a death resulting from a plane crash in Germany. Deaths occurring in the United States and Canada, not tied in with the Vietnam engagement, should also be assumed not due to war.

Due to the relatively low death rate from disease among troops in Vietnam, no deaths from disease should be considered war deaths.
