21. Disability Loss-of-Time Experience, Annual Claim Costs by Duration Measured from Date of Disablement, Elimination Period of 14 Days for Accident and 14 Days for Sickness, All Policy Durations
22. Disability Loss-of-Time Experience, Annual Claim Costs by Duration Measured from Date of Disablement, Elimination Period of 30 Days for Accident and 30 Days for Sickness, All Policy Durations

**IV. FIRST YEAR OF BENEFIT PERIOD TRENDS—1974–75, 1976–77, 1978–79, 1974–79, AND 1980.****ALL POLICY DURATIONS**

23. Annual Claim Rate for Accident and Sickness Experience, Elimination Period of 0 Days for Accident and 7 Days for Sickness
24. Claim Duration in Months for Accident and Sickness Experience, Elimination Period of 0 Days for Accident and 7 Days for Sickness
25. Annual Claim Costs per \$1 of Monthly Income Benefit for Accident and Sickness Experience, Elimination Period of 0 Days for Accident and 7 Days for Sickness
26. Annual Claim Rate for Accident and Sickness Experience, Elimination Period of 14 Days for Accident and 14 Days for Sickness
27. Claim Duration in Months for Accident and Sickness Experience, Elimination Period of 14 Days for Accident and 14 Days for Sickness
28. Annual Claim Costs per \$1 of Monthly Income Benefit for Accident and Sickness Experience, Elimination Period of 14 Days for Accident and 14 Days for Sickness
29. Annual Claim Rate for Accident and Sickness Experience, Elimination Period of 30 Days for Accident and 30 Days for Sickness
30. Claim Duration in Months for Accident and Sickness Experience, Elimination Period of 30 Days for Accident and 30 Days for Sickness
31. Annual Claim Costs per \$1 of Monthly Income Benefit for Accident and Sickness Experience, Elimination Period of 30 Days for Accident and 30 Days for Sickness

**B. Second Year of Benefit Period—Study of 1979 Exposures**

32. 0-Day Accident and 7-Day Sickness Disability Loss-of-Time Experience for Claims Incurred during 1967–72, 1973–78, and 1979 for Male Occupation Group I
33. 0-Day Accident and 7-Day Sickness Disability Loss-of-Time Experience for Claims Incurred during 1967–72, 1973–78, and 1979 for Male Occupation Group II

**INTRODUCTION TO EXPERIENCE UNDER INDIVIDUAL  
LOSS-OF-TIME POLICIES, 1980**

The first part of this study covers experience in the first year of the benefit period. Results of data submitted by thirteen companies are presented for males and females in Occupation Groups I and II. Annual claim rates, average claim durations, and annual claim costs (see section A for definitions) are shown for accident disability, sickness disability, and total accident and

sickness disability. A further part of the first-year study examines the trends in the claim rates, durations, and costs for 0-day accident, 7-day sickness, and the combination of these two during the experience periods 1974-75, 1976-77, 1978-79, 1974-79, and 1980, as well as those for 14 and 30 day elimination periods.

The second part of this study covers experience in the second year of the benefit period. For 1979, the published results are limited to male claims under policies with 0-day accident and 7-day sickness elimination periods. This is compared with results of Male I and II for 1967-72 and 1973-78. Claim rates, durations, and costs are shown for 0-day accident, 7-day sickness, and the combination of these two. Experience for Female I is given in a summary fashion, since there are insufficient data to provide detailed results.

This is the first study performed on one year of experience. This was done to make results available on a more timely basis, in a line of business whose experience tends to fluctuate between years.

#### A. EXPERIENCE IN FIRST YEAR OF BENEFIT PERIOD

This section of the report presents an analysis of morbidity experience under individual loss-of-time policies during the calendar year 1980 and a comparison of this experience with results for the periods 1974-75, 1976-77, and 1978-79. This section is limited to experience in the first year of the benefit period. Policies with benefit periods of less than one year are excluded from the study. The reporting system used for this study is generally the same as that used for the previous studies. This system is described in detail in the *1975 Reports* (pp. 126-28). Previous studies appear in the *Reports* of odd-numbered years commencing in 1959.

The tables contain experience for males in Occupation Groups I and II and also for females in Occupation Groups I and II; for convenience these four groups are referred to in the rest of this report as "Male I," "Male II," "Female I," and "Female II." The amount of data on females in Occupation Group II is relatively small; therefore, these results should be viewed with caution.

Occupation Group I consists of occupations that involve little exposure to an accident hazard and do not require heavy physical activity. In addition to those occupations involving white-collar and professional workers, Group I also includes occupations of persons engaged in trades and service work whose duties are light and nonhazardous, persons superintending manufacturing and construction operations, and so forth.

Occupation Group II consists of occupations that involve a greater degree of exposure to accident hazards or in which the physical requirements of the

job may be reflected in longer periods of disability due either to sickness or to injury than in the Group I occupations. These generally include construction workers, drivers of heavy vehicles, mechanics, those engaged in skilled and semiskilled jobs in manufacturing industries, and the like. Persons whose work requires perfect, or nearly perfect, physical condition also would be in Group II, since such persons may be disabled by a relatively minor injury.

The presentation of data generally follows the format used in prior reports. The tables include (1) annual claim rates, (2) average claim durations in months, and (3) annual claim costs. Experience is shown separately for accident and sickness. Total disability experience is represented as the sum of the separate accident and sickness experience. The combined annual claim rates, average claim durations, and annual claim costs for total disability sometimes reflect experience on different combinations of accident and sickness elimination periods.

Experience by policy duration groups is included. Policy duration is defined as being the exposure year minus the issue year. Exposure for the period in which the calendar year of exposure equals the issue year has been excluded from the total study.

Annual claim rates (or frequencies) have been calculated by dividing the amounts of monthly indemnity on claims by the corresponding exposures. The exposures are based on the amounts of monthly indemnity. Annual claim costs per \$1 of monthly income benefit have been calculated by dividing the aggregate benefits incurred on claims by the corresponding exposures. The data in all tables are expressed in terms of \$1 of monthly income benefit. Durations of claims in months, measured from the end of the elimination period, have been calculated by dividing the annual claim costs by the annual claim rates.

#### I. VOLUME OF DATA

For the calendar-year period of 1980, the study is based on about 41,000 claims. The companies that contributed to the study are shown in Table 1, together with the volume of each company's data, measured by the number of claims reported.

Table 2 shows the distribution of the number of claims reported by type of coverage, sex, occupation group, and elimination period. The number of claims can be used as a good indicator of the reliability of the statistical results. The analysis of the experience included in this study has been confined to those occupation groups and elimination periods where there is a significant amount of data. These are indicated by an asterisk in Table 2.

An additional measure of the volume of the data, the number of policy years exposed for each category, is included in Table 3. The difference

between the exposures for accident coverage and sickness coverage is due to the inclusion of accident-only policies, generally not being issued currently by the contributors, which constitute about 1.5 percent of the total monthly income exposure for accident coverages. There has been a trend toward the sale of policies that have accident and sickness elimination periods equal to each other.

About 84 percent of the monthly income exposures included in this study are from noncancelable policies, 9 percent from guaranteed renewable policies, and 7 percent from cancelable and state renewable policies. No analysis has been performed to determine whether any significant difference exists between these. Seven of the thirteen companies who contributed to this study have reported more than 90 percent of their exposure on noncancelable policies.

The average policy size in terms of dollars of monthly income exposed for each category is included in Table 4. There has been a trend toward the sale of policies with longer elimination periods, which has resulted in higher average policy sizes associated with the longer elimination periods. Tables 4A and 4B reflect the difference in average policy size between more recent issues (first five policy years) and earlier issues. As would be expected, the average policy size is higher for Occupational Group I than for Occupational Group II. Also, average policy size is higher for males than for females.

A reasonable amount of data, measured by number of claims, is available for the 0-, 7-, 14-, 30-, and 90-day accident and the 0-, 7-, 14-, 30-, and 90-day sickness coverages. The number of claims for the 90-day elimination period is relatively small; these results should be viewed with caution. No experience was submitted for 0-day sickness coverage in the first five policy durations; as a result, for this policy-year grouping, 0-day accident and sickness experience has not been combined. In general, the combination of 0-day accident and sickness experience should be viewed with caution. In interpreting results obtained from any experience study with a small amount of data, caution should be exercised, and in comparing current results with those of previous studies, it must be kept in mind that the proportion of the total experience from each company is different in the current and previous studies. In addition, the same companies have not contributed to all the studies.

In order to test the degree of variation in results by company, an analysis-of-variance study has been performed, and, even after the several variables used in this study have been taken into account, there remain statistically significant differences in experience between companies. Table 22 gives an indication of these differences by indicating variations by contributing company for overall claim costs for total disability by sex and occupation group.

## II. 1980 DISABILITY EXPERIENCE

Tables 5, 6, and 7, respectively, provide summaries of the accident, sickness, and total (sum of accident and sickness) disability experience compiled in this section, for all policy durations combined. Each table shows the three elements of disability—annual claim rates, duration of the claim in months, and annual claim cost—by the four variables studied—sex, occupation group, elimination period, and attained age. In order to give some idea of the credibility of the experience, the number of claims is shown.

Disability experience has been subdivided by policy duration. Results for the first five policy durations combined were separated from later policy durations. Tables 8, 9, and 10 provide summaries of the first five policy durations, split the same way as was done in Tables 5, 6, and 7. Tables 11, 12, and 13 provide similar summaries of the sixth and later durations. An insufficient volume of data is available for the 90-day elimination period or for Female II to warrant a subdivision by policy duration for these groups.

Table 14 provides a look at claim costs split by quinquennial age groupings for all policy durations combined.

Table 15 provides a summary of the accident, sickness, and total disability experience for 90-day elimination periods for Male I, Male II, and Female I, and by age groupings. Tables 16, 17, and 18 provide a summary of experience for Female II. These tables also compare Female II experience with that of Female I.

#### *Accident Disability (Tables 5, 8, and 11)*

Tables 5, 8, and 11 show accident disability data for four elimination periods. Table 5 covers all policy durations, Table 8 covers the first five policy durations, and Table 11 covers the sixth and later policy durations.

Claim rates generally decrease with age for males, while claim durations generally increase, with the combined effect that claim costs decrease with age for males. Male II claim costs are always greater than the corresponding Male I claim costs. The relationship between Female I and Male I depends on elimination period; claim cost ratios are often higher for females at older ages and lower at younger ages. Accident claim costs for the first five policy durations are generally higher than those for later policy durations.

A graphic comparison of accident disability claim costs for all policy durations combined is shown in Chart 1, including Female II.

#### *Sickness Disability (Tables 6, 9, and 12)*

Tables 6 (all policy durations) and 12 (sixth and later policy durations) show sickness disability data for four elimination periods; Table 9, which

covers the first five policy durations, shows only three elimination periods—no exposures were submitted for the recent period for 0-day sickness elimination period.

Sickness disability claim costs increase with age. Sickness claim costs are greater for Male II than for Male I. Sickness claim costs for Female I are greater than those for Male I through age 59. There is no significant pattern of variation in sickness claim costs between early and later policy durations.

A graphic comparison of sickness disability claim costs for all policy durations is shown in Chart 2, including Female II.

#### *Total Disability (Tables 7, 10, and 13)*

Total disability annual claim rates and annual claim costs as derived in this study are the sums of the annual claim rates and annual claim costs for accident disability and sickness disability. The method used in the calculation of claim duration is the same as described earlier. Since sickness disability annual claim rates and annual claim costs are generally much higher than corresponding rates and costs for accident disability, total disability annual claim rates and annual claim costs tend to follow the pattern of those for sickness disability. The combination of 0-day accident and 0-day sickness must be viewed with caution, particularly at the younger ages, owing to the lack of such sickness experience.

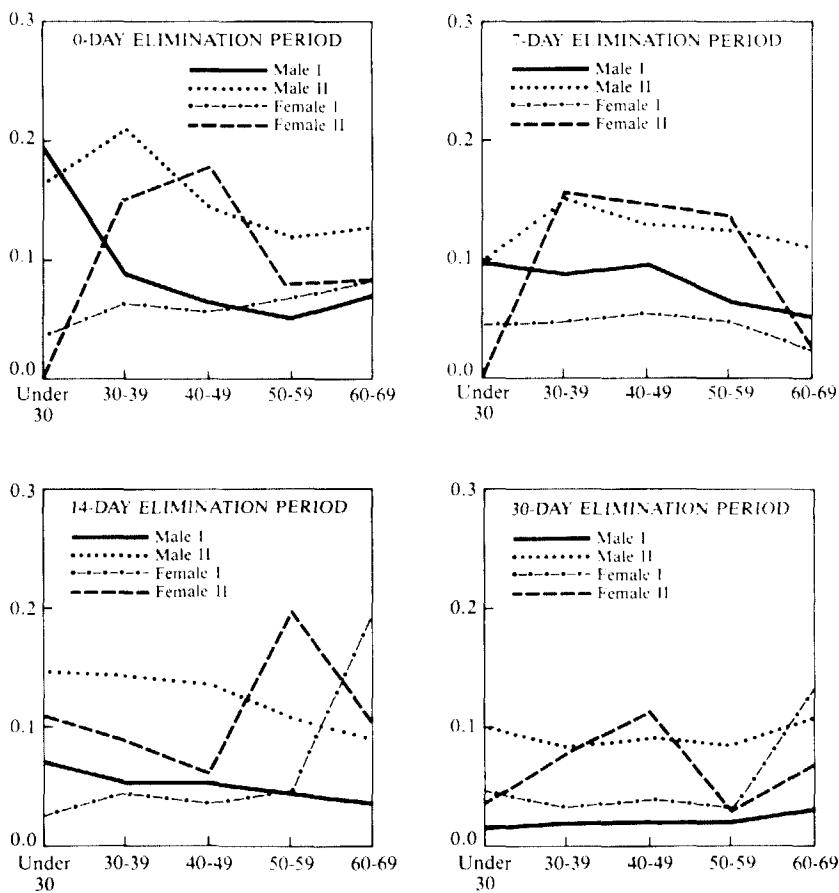

#### *Variation in Experience by Company*

Table 19 shows the variation in total claim costs for accident and sickness experience combined. The ratios in the table were calculated by weighting the ratio of each company to that of the total study for each age group/elimination period/type of disability cell by the appropriate exposure for that cell. Results show a fairly wide variation by company, with, as expected, the variation being greater for females and particularly for Female Occupation Group II, where the amount of data is smaller and where variation may be more influenced by statistical fluctuation than by true differences in underlying experience.

### **III. ANNUAL CLAIM COSTS BY DURATION SINCE DISABLEMENT**

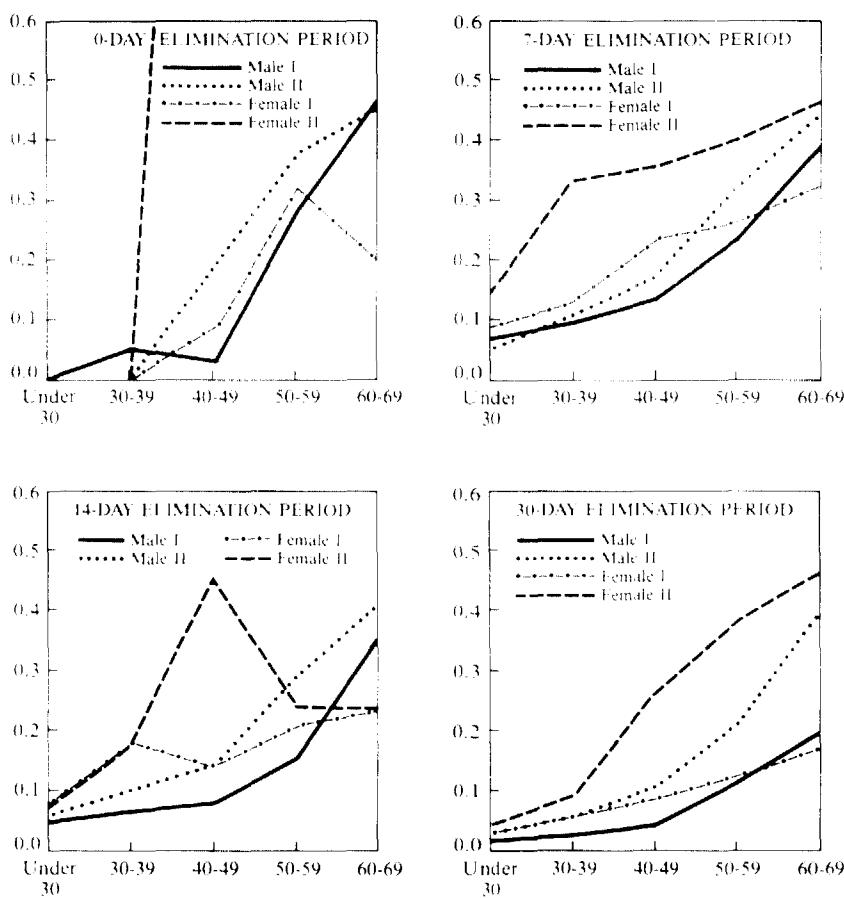

Table 20 shows annual claim costs for Male I, Male II, and Female I, by duration, measured from the date of disablement, for 0-day accident and 7-day sickness coverages. Tables 21 and 22 show these same values for 14-day and 30-day elimination periods, respectively. Corresponding tabular values from the 1964 Commissioners Disability Table (CDT) are also shown for durations beyond the seventh day of disablement. The tabular values that are shown for accident disability for the first seven days of disablement were

developed to be consistent with values in the 1964 CDT for the eighth and subsequent days of disablement.

In the comparison of crude annual claim costs with corresponding values from the 1964 CDT, a special situation exists at ages 60–69. Tabular values according to the 1964 CDT have been taken at the central age of each age group, so that the tabular value shown for age group 60–69 is the one that applies at age 65. However, because many disability policies terminate at age 65, the average age for this group is probably closer to age 63; consequently, the comparable CDT values should be somewhat lower than the values shown in Table 19. For the "Total" column in Table 19 the CDT value at age 63 for 0-day accident is 0.081, for 7-day sickness it is 0.418, and for accident and sickness it is 0.499.

It is also important to note that the 1964 CDT was intended to be a minimum reserve standard for policies providing loss-of-time benefits for disability due to accident or sickness. It was developed to provide net valuation premiums that do not vary by occupational class or sex, rather than the type of net premiums that would be considered desirable for use in preparing gross premium rates.

#### IV. TRENDS IN EXPERIENCE

Tables 23–31 show trends in the first-benefit-year experience. Tables 23, 24, and 25 show accident experience with a 0-day elimination period, sickness experience with a 7-day elimination period, and the total of these two for the four calendar-year periods 1974–75, 1976–77, 1978–79, and 1980, as well as the unweighted average of the first three periods, which reflects the experience for 1974–79. Tables 26, 27, and 28 are similar, studying 14-day accident and 14-day sickness experience trends. Tables 29, 30, and 31 are similar, studying 30-day elimination period experience trends.

##### B. EXPERIENCE IN SECOND YEAR OF BENEFIT PERIOD

Twelve companies contributed to this part of the study. The study is based on experience of the second year of the benefit period with respect to claims incurred during 1979. Previous studies of the experience during the second year of the benefit period appear in the *Reports* of odd-numbered years commencing in 1967. Experience on policies having maximum benefit periods of less than two years is omitted.

Annual claim rates have been calculated by dividing the amounts of monthly indemnity on claims that continued for twelve months from the end of the elimination period by the corresponding exposures. Annual claim costs, expressed in terms of \$1 of monthly income benefit, have been calculated by

dividing the aggregate benefits incurred on claims during the second year of the benefit period by the corresponding exposures. Durations of claims in months, with respect to the second year of the benefit period, have been calculated by dividing the annual claim costs by the annual claim rates.

Contributions to the accident portion of the study were limited to experience under policies with a 0-day accident elimination period, and contributions to the sickness portion were limited to experience under policies with a 7-day sickness elimination period. There were 341 claims in Male Occupation Group I, 697 claims in Male Occupation Group II, 30 claims in Female Occupation Group I, and 1 claim in Female Occupation Group II. The volume of data on females for the one-year experience period under the second year of the benefit period was insufficient (31 claims) to provide significant results, so female claims were excluded from this study.

With respect to the 30 Female I claims incurred in 1979, using Male I results as the expected, the 1979 ratio of actual to expected claim costs for these females on an age-adjusted basis was 182 percent. The following table illustrates the ratio of actual to expected claim costs with Male I as the expected.

Sex	Occupation Group	Accident	Sickness	Total
Male . . . . .	I	100%	100%	100%
Male . . . . .	II	224	130	157
Female . . . . .	I	83	188	182

In this study, 46 percent of the experience was contributed by one company, while 66 percent of the experience studied was contributed by three companies.

Tables 32 and 33 show second-year Male I and Male II experience, respectively, for 0-day accident, 7-day sickness, and the combined 0-day accident and 7-day sickness coverages. Each table shows experience for claims incurred in 1967-72, 1973-78, and 1979.

Included in Tables 32 and 33 are annual claim costs from the 1964 CDT. The 1964 CDT provides a useful basis of comparison with second-year costs, even though it was developed to provide valuation net premiums and not to provide net premiums that might be considered appropriate in developing gross premiums. In comparing the 1964 CDT annual claim costs with the Male I and Male II claim costs, it should be kept in mind that the 1964 CDT annual claim costs were derived from data not broken down by either sex or occupation class.

For the combined 0-day accident and 7-day sickness experience for 1979, the annual claim costs at ages under 50 for both Male I and Male II were higher than those based on the 1964 CDT. Above age 50 claim costs for Male I were lower than those based on the 1964 CDT, while the Male II costs were higher. The Male II annual claim costs were substantially higher than those for Male I at all ages.

The annual claim costs for the 1979 incurred claims are in general slightly higher than those for 1973-78.

Six companies were able to contribute to the second year of the benefit study for elimination periods other than 0-day accident and 7-day sickness. However, insufficient data were contributed for results to be published. Tentative conclusions point to lower claim costs than for the 0/7-day elimination study.
