II. SECOND AND THIRD YEARS OF BENEFIT PERIOD

- 51 Disability Experience for Male Occupation Group I, 0-Day Elimination Period for Accident and 7-Day Elimination Period for Sickness, Claims Incurred during 1979–80, 1981–82, and 1983

74 COMMITTEE ON INDIVIDUAL HEALTH INSURANCE

- 52 Disability Experience for Male Occupation Group II, 0-Day Elimination Period for Accident and 7-Day Elimination Period for Sickness, Claims Incurred during 1979-80, 1981-82, and 1983
- 53 Disability Experience for Female Occupation Group I, 0-Day Elimination Period for Accident and 7-Day Elimination Period for Sickness, Claims Incurred during 1979-80, 1981-82, and 1983
- 54 Disability Experience for Male Occupation Group I, 30-Day Elimination Period for Accident and Sickness, Claims Incurred during 1979-80, 1981-82, and 1983
- 55 Disability Experience for Male Occupation Group II, 30-Day Elimination Period for Accident and Sickness, Claims Incurred during 1979-80, 1981-82, and 1983
- 56 Disability Experience for Male Occupation Group I, 90-Day Elimination Period for Accident and Sickness, Claims Incurred during 1979-80, 1981-82, and 1983
- 57 Disability Experience for Male Occupation Group I, All Elimination Periods Combined, Claims Incurred during 1978-79, 1980-81, 1982
- 58 Disability Experience for Male Occupation Group II, All Elimination Periods Combined, Claims Incurred during 1978-79, 1980-81, and 1982

ABSTRACT

The first part of this study covers experience for the first year of the benefit period of individual disability loss-of-time policies. Results of data for the 1984-85 exposure period submitted by 13 companies are presented for males and females in Occupation Groups I and II. Annual claim rates, claim durations and claim costs (see Section I for definitions) are emphasized for accident disability, sickness disability, and the total of accident and sickness disability. Also included are claim continuation rates. Data are presented on experience by policy duration and by duration of disability, measured by policy years exposed (in addition to the normal measurement by monthly income exposed), together with various trends of experience. In addition, experience on the distribution of claims by calendar month and rates of policy termination is reported.

The second part of this study covers experience of the second year and third year of the benefit period of individual disability loss-of-time policies. For the 1983 exposure period, claim experience from the second year of the benefit period is given for Male Occupation Groups I and II and Female Occupation Group I. For the 1982 exposure period, claim experience from the third year of the benefit period is given for all elimination periods combined for Male Occupation Groups I and II.

I. EXPERIENCE IN FIRST YEAR OF BENEFIT PERIOD

This section of the report presents an analysis of morbidity experience under individual disability loss-of-time policies during calendar years 1984 and 1985. This section is limited to experience in the first year of the benefit period. Experience for policies with benefit periods shorter than one year is excluded from the study. The primary reporting system used for this study is comparable to that used in previous studies. This system is described in detail in the *TSA 1959 Reports* (pages 126-128). Previous studies appear in detail in the *TSA Reports* of odd-numbered years, commencing in 1959, along with the *TSA 1982 Reports*. Three companies were able to contribute experience on a new reporting format, information from which is used to report on policy persistency (see Section 6).

The tables contain experience for males in Occupation Groups I and II and also for females in Occupation Groups I and II; for convenience, these four groups are referred to as "Male I," "Male II," "Female I," and "Female II." The amount of data for females in Occupation Group II is

relatively small; therefore, experience for this classification should be viewed with caution.

Occupation Group I comprises occupations that involve little exposure to accident hazards and do not require heavy physical activity. In addition to those occupations involving white-collar and professional workers, Occupation Group I also includes occupations of persons engaged in trades and service work whose duties are light and nonhazardous and persons superintending manufacturing and construction operations.

Occupation Group II comprises occupations that involve a greater degree of exposure to accident hazards or in which the physical requirements of the job may be reflected in longer periods of disability due to sickness or to injury than in the Group I occupations. These occupations include construction workers, drivers of heavy vehicles, mechanics, and skilled and semi-skilled workers in manufacturing industries. Occupations requiring perfect, or nearly perfect, physical condition also would be included in Group II, because persons in such occupations may be disabled by what would otherwise be considered a minor injury.

In general, the presentation of data in many of the following tables follows the format used in prior reports. Most tables include: (1) annual claim rates, (2) average claim durations in months, and (3) annual claim costs per \$1 of monthly income benefit. Experience is shown separately for accident and sickness causes of disability. Total disability experience is represented as the sum of the separate accident and sickness experience. Claim rates and claim costs for total disability are equal to the sum of the corresponding values for accident disability and sickness disability. Claim durations for total disability are usually between those for accident disability and sickness disability. Exposures for total disability in Tables 9, 12, 16, 19, and 36 include the exposures for both accident disability and sickness disability and thus are the sum of the two, rather than the sum of exposures for the policies included in this study. The combined annual claim rates, average claim durations and annual claim costs for total disability sometimes reflect experience on different combinations of accident and sickness elimination periods, particularly those of shorter elimination periods.

Experience by policy duration groups is included. Policy duration is defined as being equal to the exposure year minus the issue year. Exposure for the period in which the calendar year of exposure equals the issue year has been excluded from both the policy-year section of this study and the total study.

Annual claim rates (or frequencies or rates of disability incidence) are calculated by dividing the amounts of monthly indemnity on claims for a segment of the experience by the corresponding exposures for the segment. These exposures are based on the amounts of monthly indemnity.

Annual claim costs per \$1 of monthly income benefit are calculated by dividing the aggregate benefits incurred on claims by the corresponding exposures. The data in all tables except for those in Tables 34-37 are expressed in terms of monthly income benefit. The data in Tables 34-37 are based on exposure expressed in terms of policy-years and on claims expressed in terms of number of claims; otherwise, the method of calculation is the same.

Durations of claims in months, measured from the end of the elimination period, are calculated by dividing annual claim costs by the annual claim rates.

Payments for residual and partial disability benefits are not included in this study. Only total (or full) disability benefits are considered.

Some of the experience included in the 1982-83 study was misclassified between Occupation Group I and Occupation Group II. The overall results of the 1982-83 study do not appear to have been significantly affected by this misclassification. The corrected experience for these years is included in this report in Tables 20-22, Tables 28-32, and Tables 38-49.

A. General Characteristics of the Data

For the calendar-year exposure period of 1984 and 1985, the study is based on approximately 32,000 claims. The companies that contributed to the study are shown in Table 1, together with the volume of each company's data, separated by year of exposure and measured by the number of claims reported.

Table 2 shows the distribution of the number of claims reported by type of coverage, sex, occupation group, and elimination period. The number of claims is often used as an indicator of the reliability of the statistical results of such a study.

An additional measure of the volume of the data, the number of policy years exposed for each category, is included in Table 3. The primary difference between the total exposures for accident coverage and those for sickness coverage is the inclusion of policies that cover only the disability hazard of accident, which constitute less than 1 percent of the exposure for accident coverages. The trend toward the sale of policies that have accident and sickness elimination periods equal to each other has continued.

All Elimination Periods	840,587	216,838	110,587	9,172	833,746	210,635	110,560	8,997

Approximately 95 percent of the exposures included in this study are from noncancelable policies, 4 percent from guaranteed renewable policies, and 1 percent from policies that are cancelable or renewable on a state-by-state basis. No analysis has been performed to determine whether any significant difference exists between policies with these different renewal provisions.

The average policy size in terms of dollars of monthly income exposed for each category is included in Table 4. A trend toward the sale of policies with longer elimination periods has resulted in larger average policy sizes associated with longer elimination periods. Data in Tables 5 and 6 indicate that there exists a difference in average policy size between more recent issues and earlier issues. As would be expected, the average policy size is larger for Occupation Group I than for Occupation Group II. The average policy size is larger for males than for females.

The amount of data, measured by number of claims, is sufficient to report on accident coverages with 0-, 7-, 14-, 30-, 60-, and 90-day elimination periods and sickness coverages with 0-, 7-, 14-, 30-, 60-, and 90-day elimination periods.

The amount of data for the 60- and 90-day elimination periods is relatively small; therefore, these data should be viewed with caution. Four companies were able to contribute experience with a 180-day elimination period. Experience for policies with a 180-day elimination period is included only in Tables 1-9 and Tables 34-37. A relatively small amount of experience was

submitted for 0-day elimination period for sickness coverage; as a result, 0-day accident and sickness experience has not been combined in several of the data presentations. In general, the combination of 0-day accident and sickness experience should be viewed with caution because 0-day sickness coverage has not been sold for many years.

The amount of data for Female II is limited; as a result, experience for Female II is provided only in certain of the data presentations.

In interpreting results obtained from an experience study with a small amount of data, caution should be exercised because of potential statistical fluctuations. In comparing current results with those of previous studies, keep in mind that the proportion of the total experience from each company is different in the current and previous studies. In addition, the same companies have not contributed to all the studies. Even if they did, the results of any intercompany study may not be appropriate to be applied to a specific company, due to the differences in circumstances of that company compared to the aggregate of several other companies.

In order to test the degree of variation in results by company, an analysis of variance study has been performed; even after taking into account the several variables used in this study, statistically significant differences in experience between companies remain. Table 13 provides some insight into these differences by indicating overall variations by contributing company for claim rates, claim durations, and claim costs.

B. 1984-1985 Disability Loss-of-Time Experience

Tables 7, 8, and 9 provide summaries of the accident, sickness and total (sum of accident and sickness) disability experience, respectively, compiled in this section, for Male I, Male II, and Female I for all policy durations combined. Each table shows the three elements of disability experience (annual claim rate, duration of the claim in months, and annual claim cost) by the four variables studied (sex, occupation group, elimination period, and attained age). Quinquennial attained age groupings are used in these tables. To provide an indication of the credibility of the experience, the amount of monthly indemnity exposed and the number of claims are also shown.

Several observations about patterns discernible from these tables are as follows:

- Claim rates for accident coverages, as displayed in these tables, tend to be level or to increase by attained age, depending upon elimination period.
- Although accident claim durations for both sexes tend to increase by age, patterns for some sex/occupation group/elimination period combinations are not clear, particularly for longer elimination periods.
- Claim costs for accident coverages tend to be level or increase by attained age; however, this is not true for all categories.
- Claim costs for accident coverages tend to be larger for Male II than for Male I.
- The relationship between accident experience of Female I and Male I depends upon attained age and elimination period.
- Claim rates, claim durations, and claim costs for sickness coverages tend to increase in size by attained age.
- For a few sex/occupation group/elimination period combinations, rates or durations are level by attained age.
- Claim costs for sickness coverages are larger for Male II than for Male I.
- Claim costs for sickness coverages for Female I tend to be larger at younger attained ages than for Male I, with the reverse generally true at older attained ages. This claim cost relationship appears to be caused by differences in relative claim rate experience, rather than in relative claim duration experience.
- Overall claim costs for sickness coverages appear to become larger for Female I than for Male I the longer the elimination period.
- Total annual claim rates and claim costs tend to follow the pattern of those for sickness disability, because claim rates and claim costs for sickness disability tend to be much larger than the corresponding claim rates and claim costs for accident disability, particularly for Female I and older ages.

Tables 10, 11, and 12 provide a summary of accident, sickness, and total disability experience, respectively, for Female II. These tables also compare Female II experience to that of Male II and Female I. Claim costs for Female

II appear significantly larger than those for Female I, caused primarily by larger claim rates.

The following table shows a distribution of number of claims by month of occurrence of disability. Considerable variation by company exists.

Month	Percentage of Disability Claims by Incurral Month		
	Accident	Sickness	Total
January	10.6%	11.4%	11.1%
February	9.0	8.9	8.9
March	8.1	8.9	8.7
April	8.0	8.7	8.5
May	8.4	8.4	8.4
June	8.2	8.1	8.1
July	9.1	7.9	8.3
August	8.0	7.4	7.6
September	7.7	7.5	7.6
October	8.5	7.6	7.9
November	7.3	7.6	7.5
December	7.0	7.6	7.4

Table 13 shows the percentage variation by contributing company in claim rates, claim durations, and claim costs, for total disability loss-of-time experience. The ratios in the table were calculated by weighting the ratio of each company's experience factor to that of the total study for each decennial age group/elimination period/type of disability combination by the exposure for that cell (by indemnity on claim for the calculations for claim duration rather than by indemnity of exposure as is done for claim rates and claim costs). Both the number of companies and the percentage of total number of claims by range of deviation from the study average are given. Because the ratios are calculated on the basis of exposure, the distribution of percentage of number of claims does not always correspond to the variation in experience. Results indicate a wide variation by company, with a larger variation in claim rate and claim cost than in claim duration.

C. Disability Loss-of-Time Experience by Policy Duration

Disability loss-of-time experience has been segmented by duration since policy issue. Policy duration is defined as the number of calendar years since policy issue, with experience from the calendar year of issue excluded.

Results for the first five policy durations combined were separated from later policy durations. Tables 14-16 provide summaries of the first five policy durations combined, in the same manner as in Tables 7-9. Tables 17-19 provide comparable summaries for the sixth and later policy durations

combined. Sufficient data are not available for Female II for this purpose; therefore, data for this category are not reported.

In addition to the preceding comparison, an in-depth analysis was performed by policy duration for claim costs. Results are presented in Tables 20, 21, and 22 for Male I, Male II, and Female I, respectively. For each decennial attained age grouping for accident and sickness, claim costs were compared for policy duration groupings 1, 2, 3, 4, 5, 1-5, 6-10, 11-15, 16-20, and 21 and later to claim costs for all policy durations combined. Claim costs for total disability are the sum of the claim costs for the corresponding accident and sickness elimination periods. These ratios were weighted by the appropriate monthly indemnity exposures to derive overall ratios by sex and occupation group, with subtotals available by elimination period and type of disability. Results are also provided by decennial age groupings for all elimination periods combined. To provide more stable results, experience was combined for exposure years 1982 through 1985. Results for exposure years 1984 and 1985 are provided for all elimination periods combined for comparison.

Claim costs for accident disability tend to be larger during early policy durations. Overall, during the first two policy durations, smaller sickness claim costs exist for all categories except for Male II, in which the opposite holds for the 1984-85 experience, and for Male II, in policy duration two. Claim costs for older policies (policy durations 16 and later) tend to be smaller than those for more recent issues. No discernible differences in these trends by age are apparent.

In drawing conclusions from these results, keep in mind that benefit provisions, policy definitions, contributing company mix, and underwriting standards may have been different among different eras of disability income policies issued. Because of limited claim data for policies with 0-, 60- and 90-day elimination periods, significant fluctuations for results for these policies exist in Tables 20-22.

D. Disability Loss-of-Time Experience by Duration of Disability

Table 23 shows claim costs for Male I, Male II, Female I, and Female II by duration, measured from the date of disablement for a 0-day elimination period for accident and a 7-day elimination period for sickness coverages. Tables 24 and 25 show these same values for 14- and 30-day elimination periods, respectively. Tables 26 and 27 show these same values for Male I,

Male II, and Female I for 60- and 90-day elimination periods, respectively. Corresponding tabular values from the 1964 Commissioners Disability Table (CDT) are also shown for claim durations beyond the seventh day of disablement. The tabular values that are shown for accident disability for the first seven days of disablement were developed to be consistent with values in the 1964 CDT for the eighth and subsequent days of disablement.

In the comparison of crude claim costs with corresponding values from the 1964 CDT, a special situation exists at ages 60 to 69. Tabular values according to the 1964 CDT have been taken at the central age of each group, so that the tabular value shown for age group 60-69 is that for age 65. However, because many disability policies terminate at age 65, the average age for this group is probably closer to age 63; consequently, the comparable CDT values should be somewhat smaller than the values shown in Tables 23-27. For the "total" column in Table 23, the CDT value at age 63 for 0-day accident is 0.081; for 7-day sickness, it is 0.418; and for accident and sickness combined, it is 0.499.

Note that the 1964 CDT was intended to be a minimum reserve standard for policies providing loss-of-time benefits for disability due to accident or sickness. It was developed to provide net valuation premiums that do not vary by occupational class or sex, rather than the type of net premiums that would be considered desirable for use in preparing gross premium rates.

Tables 28, 30, and 32 provide claim continuation rates for Male I, Male II, and Female I, respectively, for accident disability and Tables 29, 31, and 33 for sickness disability for the 1982-85 exposure years. These claim continuation rates represent the probability that a dollar of monthly indemnity exposed has continued to be paid out as a disability claim as of the end of the given period measured from the time of disablement. Claim continuation rates for total disability are the sum of claim continuation rates for accident disability and sickness disability for the appropriate elimination periods. To provide added credibility to these continuation rates, claim experience corresponding to the 1982-85 exposure years was used. Because of limited data at the later claim months in the first year of disability benefit, significant fluctuations occur in experience for certain elimination periods, particularly for 60- and 90-day elimination periods, and for attained age groupings under 30 and 60-69; these results should be viewed with caution. The period for which disability continues, which is the basis of the calculation of these claim continuation rates, was based upon the amount of indemnity paid divided by the monthly indemnity exposed, not upon the actual period of disability. The data contributed did not permit a reliable calculation of a

claim continuation rate for the twelfth month after the end of the elimination period. Therefore, such claim continuation rates are not included in these tables. Also included in these tables are the amount of monthly indemnity exposed and the claim rate for the appropriate sex/occupation/elimination/type of disability grouping.

Claim continuation rates for males tend to decrease as the elimination period lengthens. This appears to be primarily caused by differences in claim incidence rates rather than by differences in claim termination rates. Patterns of rates of claim continuation for Female I do not appear to decrease as consistently as for males, possibly because of the relatively smaller amounts of experience for this category.

To illustrate the relationships between claim continuation rates by elimination period, claim continuation rates for age group 40-49 for the 1982-85 experience period are illustrated on Charts I through VI for Male I Accident, Male II Accident, Female I Accident, Male I Sickness, Male II Sickness, and Female I Sickness categories, respectively.

E. Disability Loss-of-Time Experience with Exposures and Claims Expressed in Terms of Policy Years

Tables 34-37 correspond to Tables 7-9 with one difference. The calculations were performed on the basis of policy years exposed, claim counts, and claim duration in terms of number of incurred claim months, rather than on exposures and claims in terms of amounts of monthly indemnities. This provides an overall indication of relative experience by policy size.

Table 37 provides ratios of claim costs from Tables 7, 8, and 9 to those given in Tables 34, 35, and 36, respectively. These ratios were calculated on the basis of decennial age groupings. Claim costs apparently are larger when measured by monthly indemnity, which indicates possible antiselection by insureds with larger policies.

F. Disability Loss-of-Time Experience Trends

Tables 38-43 show ratios of experience for the first benefit year for the 1984-85 exposure years to the 1978-85 exposure years combined. The claim rates, claim durations and claim costs given in Tables 38-42 are the aggregate values of the eight-year period. The values given for the 1984-85 exposure years are the ratios of the values for that period to the total of the combined experience of the eight-year period.

FOR FEMALE OCCUPATION GROUP I, AGES 40-49
1982-85 EXPERIENCE

Table 38 shows these experience trends for a 0-day elimination period for accident coverage and for a 7-day elimination period for sickness coverage, and the total of these two, for claim rate, claim duration, and claim cost. Tables 39, 40, 41, and 42 show these same trends for experience for 14-, 30-, 60-, and 90-day elimination periods, respectively. The ratios for all attained ages combined for claim rates and claim costs were calculated by using monthly indemnity exposed as weights for the attained age group ratios, while ratios for all attained ages combined for claim durations were calculated by using monthly indemnity on claims as weights for the attained age group ratios.

Table 43 shows the ratio of these values for the 1984-85 exposure year to the corresponding values for the 1978-1985 exposure years, for all elimination periods combined, weighted over all elimination periods and age groups in a manner comparable to the weighting used in Tables 38-42. For all elimination periods combined for total disability, claim duration tends to be longer for males and approximately equal for females for the 1984-85 exposure year compared to 1978-85. Claim rates tend to be smaller for males and larger for females for 1984-85. Overall, claim costs were approximately 102 percent for Male I, 101 percent for Male II, and 112 percent for Female I for 1984-85 when compared to 1978-85.

The following table (taken from Table 43) includes the weighted ratios (by monthly indemnity exposed) of claim costs of 1978-79, 1980-81, 1982-83, and 1984-85, as well as for 1984 and 1985 separately, for accident and sickness disability combined.

WEIGHTED RATIOS OF CLAIM COSTS TO 1978-1985

Exposure Years	Male I	Male II	Female I
1978-79	0.997	1.048	0.986
1980-81	1.019	1.034	0.832
1982-83	0.949	0.984	1.022
1984	0.888	0.934	1.001
1985	1.177	0.894	1.178
1984-85	1.027	0.914	1.096

Trends for the ratios of experience of Male II to Male I for the periods 1978-79, 1980-81, 1982-83, and 1984-85 are given in Tables 44, 45, and 46 for claim rate, claim duration, and claim cost, respectively. These trends are provided for all elimination periods included in this report. No consistent trend in these ratios is apparent over this eight-year period, although there

has been a decrease in the 90-day elimination period. The ratios between Male II and Male I claim rates and claim costs are larger for accident disability than for sickness disability.

Tables 47-49 include comparable trends in ratios of Female I to Male I experience. The ratios for all attained ages combined are weighted on the basis of the monthly income exposed for claim rates and claim costs and the monthly income on claims for claim durations. The ratios between Female I and Male I claim rates and claim costs tend to increase as the elimination period increases. Although no consistent overall trend over the entire eight-year period is apparent (as different trends occur in different elimination periods, types of disability, and attained age groupings), the ratios of Female I to Male I claim costs appear to have increased during the eight years included in this review. Overall, claim rates and claim costs are larger for

Female I compared to those for Male I; however, this relationship is sometimes reversed at attained age group 60–69 and less frequently at attained age group 50–59. Ratios for claim rates and claim costs tend to be larger for accident disability than for sickness disability.

G. Persistency

Three companies contributed policy termination experience for calendar year 1985. As a result of this limited exposure, results for this part of the study should be viewed with caution.

Policy termination rates are defined as the number of policies that terminated from all causes (including nonpayment of premiums, death, and expiry of coverage) divided by the number of policies exposed during the calendar year. Both the numerator and denominator include a full policy count for policies that terminated during the year and for policies issued during the year.

Experience was separated by decennial issue age grouping, in contrast to the separation of experience for the rest of this report, which is by attained age group. Experience for policy duration zero (policies issued during 1985) is included. Because only a portion of a policy year is exposed during this policy duration, the policy termination rate is relatively low compared to that of policy duration one.

Certain companies could not separate policies whose policy period expires from policy withdrawals. As a result, policy termination rates at the older issue ages/policy durations appear high relative to other issue age/policy duration combinations.

Table 50 shows policy termination experience by policy duration (1, 2, 3, 4, 5, 6–10, and 11 and later) and by Male I, Male II, Female I, and all sexes and occupational groups combined.

The overall policy termination rate was 9.7 percent. The three contributing companies experienced overall policy termination rates of 7.2 percent, 9.5 percent and 10.9 percent. Policy termination rates are impacted by many factors, including mix of business and method of distribution. Therefore, comparisons of overall company policy termination rates should be made with caution.

II. EXPERIENCE IN SECOND AND THIRD YEARS OF BENEFIT PERIOD

Seven companies contributed to this part of the study. The study is based on experience of the second year of the benefit period with respect to claims

incurred during 1983 and of the third year of the benefit period with respect to claims incurred during 1982. Previous studies of experience during the second year of the benefit period appear in *TSA Reports* of odd-numbered years commencing in 1967 and in the 1982 *TSA Reports*. Experience on policies having maximum benefit periods less than two years is omitted in the second-year study and less than three years in the third-year study. Caution should be used in interpreting the results of certain sex/age/occupation/elimination period cells because of a scarcity of claims and in interpreting

trends because of a change in the companies that contributed to this and previous studies.

Annual claim rates have been calculated by dividing the amounts of monthly indemnity on claims that continued for at least 12 months for the second-year study and at least 24 months for the third-year study, measured from the end of the elimination period, by the corresponding exposures. Annual claim costs, expressed in terms of \$1 monthly income benefit, have been calculated by dividing the aggregate benefits incurred on claims during the second or third year of the benefit period, depending on the study, by the corresponding exposures. Durations of claims in months in the appropriate benefit year have been calculated by dividing the annual claim costs by the annual claim rates.

Experience included in this study is reported in two sections. The first is comparable to that of most of the previous studies, including experience under policies with a 0-day accident elimination period and under policies with a 7-day sickness elimination periods during the second benefit year. Seven companies contributed to this section of the study.

The second section of this study reports, for the third time, second-benefit-year experience under policies with other than a 0-day accident elimination period and a 7-day sickness elimination period, and third-benefit-year experience for policies with all elimination periods combined. Six companies contributed to this section of the study. As a result of the differences in companies contributing to these two sections, caution must be used in comparing their results.

For this section for the study, there were 55 claims reported in Male I, 78 claims in Male II, 8 claims in Female I, and 2 claims in Female II.

Tables 51, 52, and 53 report on second-year Male I, Male II, and Female I experience, respectively, for a 0-day elimination period for accident, a 7-day elimination period for sickness, and combined 0-day accident and 7-day sickness elimination period. These displays include experience for claims incurred in 1979-80, 1981-82, and 1983.

Included in Tables 51-53 are corresponding claims costs from the 1964 Commissioners Disability Table (CDT). The 1964 CDT provides a useful basis of comparison with second-year claim costs, even though it was developed to provide valuation net premiums and not to provide net premiums that might be considered appropriate in developing gross premiums. In comparing claim costs, keep in mind that the 1964 CDT claim costs were derived from data not broken down by either sex or occupation group.

Tables 54, 55 and 56 report on second-year Male I experience for 30-day elimination period, Male II experience for 30-day elimination period, and Male I experience for 90-day elimination period, respectively. The data in these tables and Tables 51-53 indicate that the initial elimination period still has a significant impact on claim costs in the second benefit year. Claim costs that are smaller for longer elimination periods are partially, but not totally, explained by the fact that this experience is slightly further away from the date of disability. Also, Male I claim costs are smaller than those for Male II for this experience.

Tables 57 and 58 report on experience for Male I and Male II, respectively, for all elimination periods combined during the third benefit year for claims incurred during 1980 and 1981. Studies have shown that there are differences in experience by elimination period in the third benefit year. The number of claims for females was insufficient to report on their experience for this study.
